Thrust Bearings

From the three-digit "Series" number, it is known this is an inch size bearing. "50" is read as "5.0" and represents approximate or actual bore.

The series number (always three numerals) represents a specific size cage assembly.

- TVB** Thrust Ball Bearings
- TVL** Angular Contact Thrust Ball Bearings
- DTVL** Angular Contact Thrust Ball Bearings – upper and lower complement of balls
- TP** Thrust Cylindrical Roller Bearings
- TPS** Thrust Cylindrical Roller Bearings – Two bottom washers
- TTHD** Thrust Tapered Roller Bearings

INTRODUCTION

Four basic designs of thrust rolling bearings are available from Torrington: ball, spherical roller, cylindrical roller and tapered roller. Dimensional data for all styles are presented in order by bore size.

Engineering data such as tolerances, shaft and housing fits, and life and load rating calculations are found in the Engineering section of this catalog.

Bearing Types

THRUST BALL BEARINGS

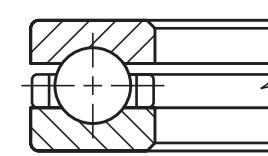

Torrington thrust ball bearings provide optimum performance in high speed installations, particularly where loads are generally lighter.

Two basic types of thrust ball bearings are available from Torrington, axial (TVB), and angular contact (TVL). Torrington also offers a DTVL type, with both an upper and lower complement of angular contact balls and three race elements.

Torrington standard tolerances for thrust ball bearings (both types) are equivalent to ABEC-1 where applicable, but higher precision tolerances are available. Consult a Torrington sales engineer about such installations.

TVB

Torrington TVB thrust bearings are separable, and consist of two hardened and ground steel washers. The precision ground and lapped balls run in a grooved raceway, separated by a bronze cage. Other materials may be specified for the cage, depending on the application.

TVB

TVB ball thrust bearings provide axial rigidity, but are not recommended if radial loading is expected.

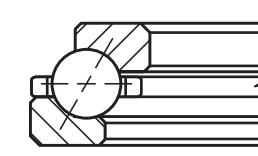

TVB bearings are exceptionally easy to mount, with the rotating washer usually shaft mounted. The stationary washer should be housed with an outside diameter clearance that allows the bearing to assume a normal operating position.

Most TVB bearings made by Torrington include washers of the same bore and outside diameter. Housings should therefore be designed to clear the O.D. of rotating washers, with shafts stepped to clear the bore of stationary washers.

TVL

Torrington TVL angular-contact thrust ball bearings provide exceptionally low friction, cool running and quiet operation when operated at high speeds. They are also less sensitive to misalignment.

While TVL bearings have been designed exclusively for thrust loads, the angular contact design will accommodate some radial loading. Consult a Torrington sales engineer for assistance in determining the limits of such loading for specific applications.

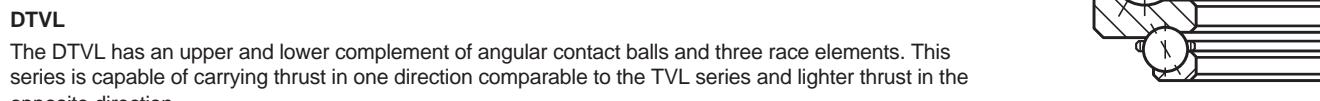

TVL

The hardened and ground steel races of TVL bearings enclose a complement of precision ground and lapped steel balls, separated by a bronze cage (other material may be specified as required).

Although TVL is not strictly an annular ball bearing, the larger ring is identified as the outer ring; the smaller as the inner. The inner ring is usually the rotating element and is shaft mounted. The outer ring, normally stationary, should be mounted with an outside diameter clearance that allows the bearing to assume a normal operating position. If combined loads are expected, the outer ring must be radially located in the housing.

TVL bearings should always be operated under thrust loading, as will happen in the usual applications for thrust ball bearings (oil field rotary tables or machine tool indexing tables). If a constant thrust load is not normally present, it should be imposed by springs or other devices.

DTVL

DTVL

The DTVL has an upper and lower complement of angular contact balls and three race elements. This series is capable of carrying thrust in one direction comparable to the TVL series and lighter thrust in the opposite direction.

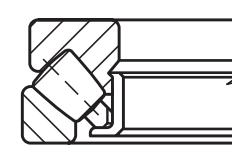

THRUST SPHERICAL ROLLER BEARINGS

TSR

The Torrington self-aligning thrust spherical roller bearing is a combination radial and thrust bearing, designed to operate even if shaft and housing are, or become, misaligned under load. This type of heavy-duty bearing is the favored choice when conditions include heavy loads, plus difficulties in establishing or maintaining housing alignment, or when shaft deflection can be expected.

Shaft deflections and housing distortions caused by shock or heavy loads (which lead to misalignment) are compensated for by the internal self-alignment of the bearing elements during operation. Corner loading of rollers, a condition that limits service life on other types of bearings, cannot develop in spherical roller thrust bearings.

Torrington spherical roller thrust bearings achieve high thrust capacity and allow axial misalignment between the inner ring and the outer ring of up to $\pm 2.5^\circ$. Spherically contoured rollers, arranged in a steep angular position, not only accept high axial loads, but moderate radial loads as well. Torrington "E" styles (EM - machined bronze cage, EJ - stamped steel cage) have increased capacity. Should extreme conditions of loading and/or speed under misalignment be anticipated, Torrington engineers should be consulted before ordering.

TSR

THRUST SPHERICAL ROLLER BEARINGS *(continued)*

The inherent compensation for misalignment provided by the spherical roller bearing offers the designer the opportunity to use weldments for housing frames instead of complex castings, eliminating high-cost machining operations. Even when castings may be preferred, bore alignment is less critical if spherical roller bearings are specified.

THRUST CYLINDRICAL ROLLER BEARINGS

Torrington thrust cylindrical roller bearings have been designed to operate under heavy loads at moderate speeds. Standard versions of these bearings can be operated at peripheral speeds (bearing O.D.) of up to 3000 feet per minute. Special Torrington design features are available for both the bearing and mounting which will permit even higher rotational speeds for this type of bearing. Two types of cylindrical roller thrust bearings, TP and TPS, are available from Torrington.

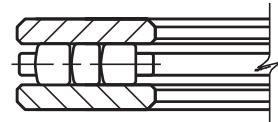

TP

Torrington TP thrust bearings have two flat hardened and ground steel washers with a cage retainer holding one or more Controlled-Contour rollers in each pocket. If specifications call for two or more rollers per pocket, they are manufactured to different lengths. The longer rollers are placed in alternate positions in adjacent pockets. The overlapping roller paths prevent "grooving" of the washers and prolong bearing life. Because of the simplicity of their design, standard TP thrust bearings are among the most economical to buy and install. Minor radial displacement of the races does not affect the operation of the TP bearing, resulting in manufacturing economies and simplified installation.

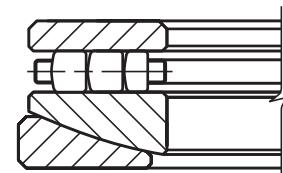

Shaft and housing seats must be square to the axis of rotation to prevent initial misalignment problems.

TPS

The Torrington TPS bearing is similar to the TP style, except that the bottom washer assembly is comprised of two washers, with the contacting faces spherically ground. The TPS bearing is thus self-adjusting to initial misalignment. It is not, however, recommended for installations where alignment may be continuously changing (dynamic misalignment).

TP

TPS

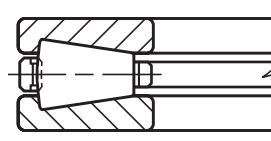

THRUST TAPERED ROLLER BEARINGS

Torrington true rolling thrust tapered roller bearings include rollers which have conical sections. These bearings have been engineered so that the rollers and raceways form a cone whose vertex is on the center line of the bearing. This bearing geometry assures a true rolling motion. In addition, the large end of each tapered roller is spherically ground so that its curvature matches the concave face of the washer rib. Pressure between the rib and roller, under load, guides the rollers accurately. Torrington manufactures three types of thrust tapered roller bearings: standard (TTHD), V-Flat (TTVF) and self-aligning V-Flat (TTVS).

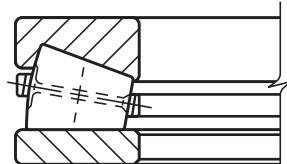

TTHD

The standard TTHD bearing has an identical pair of hardened and ground steel washers, with tapered raceways. Since both washers have the same bore and O.D., housings should be designed to clear the O.D. of rotating washers and shafts stepped to clear the bore of stationary washers. The Controlled-Contour tapered rollers are equally spaced by a cage.

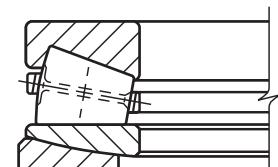

TTHD bearings are well suited for applications where extremely high thrust loads and heavy shock may be encountered, such as in crane hooks. For very low speed applications with unusually high loading, Torrington TTHD bearings can be supplied with a full complement of rollers. These bearings are identified in the tables by the suffix 278 following the bearing number. Applications for full-complement bearings should be reviewed with a Torrington sales engineer to assure selection of the proper bearing.

TTHD

TTVF

TTVS

TTVF, TTVS

V-Flat Tapered Roller bearings (TTVF and TTVS) combine the outstanding features of thrust tapered and cylindrical roller bearings to offer the highest possible capacity of any thrust bearing of its size. In the V-Flat design, one washer is flat, while the second has a tapered raceway matching the rollers. The design was originally developed for screwdown applications in metal rolling mills where thrust loads exceeding one million pounds are common.

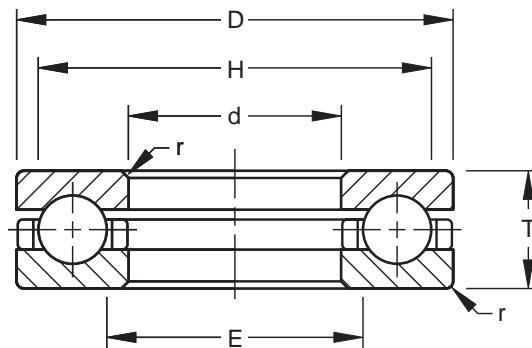

Torrington V-Flat bearings have exceptional dynamic capacity within a given envelope and provide superior static capacity. They have been highly successful in heavily loaded extruders, in cone crushers and other applications where a wide range of operating conditions are found. Most sizes of V-Flat bearings utilize cages with hardened pins through the center of the rollers. This allows closer spacing of the rollers to maximize capacity. Smaller sizes have cast bronze cages, carefully machined to permit full flow of lubricant. Self-aligning V-Flat bearings (TTVS) employs the same basic roller and raceway design, except the lower washer is in two pieces, with the contacting faces spherically ground to permit self-alignment under conditions of initial misalignment. TTVS bearings should not be used, however, if dynamic misalignment (changing under load) is expected.

Thrust Ball Bearings

Type TVB

Type TVB thrust ball bearings are designed for optimum performance in high speed installations. They provide axial rigidity, but are not recommended if radial loading is expected. Type TVB is exceptionally easy to mount, with the rotating washer usually shaft-mounted.

⁽¹⁾ Maximum shaft or housing fillet radius which bearing corners will clear.

Angular Contact Thrust Ball Bearings Type TVL

Type TVL angular contact thrust ball bearings provide exceptionally low friction, cool running and quiet operation when run at high speeds.

Although designed exclusively for thrust loads, Type TVL will accommodate some radial loading.

Angular Contact Thrust Ball Bearings Type DTVL

Type DTVL angular contact thrust ball bearings are capable of carrying thrust in one direction, plus a lighter thrust in the opposite direction.

They are designed with an upper and lower complement of angular contact balls and three race elements.

Check for availability.

Thrust Spherical Roller Bearings Type TSR

Type TSR thrust spherical roller bearing design achieves a high thrust capacity with low friction and continuous roller alignment. Spherically contoured rollers, arranged in steep angular position, not only accommodate high thrust loads but support moderate radial loads as well. The low friction of this bearing results from a combination of bearing geometry and manufacturing technology.

(1) Maximum shaft or housing fillet radius which bearing corners will clear.

(2) Centrifugal force constant. See Engineering section page E59 for calculations using this factor.

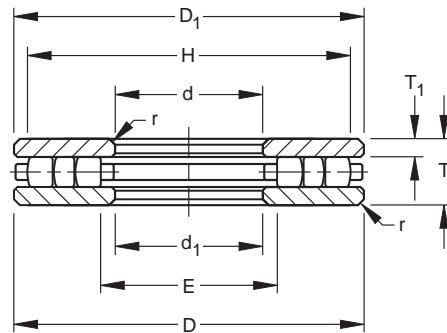

Thrust Cylindrical Roller Bearings

Type TP

The design simplicity of the standard Type TP thrust cylindrical roller bearing makes it among the most economical to buy and install.

Minor radial displacement of the races does not affect its operation, resulting in manufacturing economies and simplified installation.

⁽¹⁾ Maximum shaft or housing fillet radius which bearing corners will clear.

Thrust Cylindrical Roller Bearings Type TPS

The Type TPS thrust cylindrical roller bearing is similar to the type TP except one washer is spherically ground to seat against an aligning washer, thus making it adaptable to initial misalignment.

It is not recommended for operating conditions where alignment is constantly changing.

⁽¹⁾ Maximum shaft or housing fillet radius which bearing corners will clear.

Thrust Tapered Roller Bearings Type TTHD

Type TTHD thrust tapered roller bearings are well suited for applications, such as in crane hooks, where high thrust loads and heavy shock may be encountered.

Suffix 278 in the bearing number indicates a full complement of rollers without cage. These full complement bearings are used only in slow speed applications.

⁽¹⁾ The fillet radius for shaft or housing should be a minimum of $\frac{1}{64}$ " less than r.

Thrust Tapered Roller Bearings Type TTVF

Thrust V-Flat Tapered Roller bearings Type TTVF combine the outstanding features of thrust tapered and cylindrical roller bearings to offer the highest possible capacity of any thrust bearing of its size. In the V-Flat design, one washer is perfectly flat, while the second includes a tapered raceway matching the rollers. The design was originally developed for screwdown applications in metal rolling mills where thrust loads exceeding one million pounds are common.

⁽¹⁾ Maximum shaft or housing fillet radius which bearing corners will clear.

Thrust Tapered Roller Bearings Type TTVS

V-Flat Tapered Roller bearings Type TTVS have the same basic roller and raceway design as the TTVF except that the lower washer is two pieces, to permit self-alignment under conditions of initial misalignment.
