

QuadLube[®], SpreadLock[®] Seal, ImpactTuff[®]

Spherical Plain Bearings

Innovative product features that provide unique performance advantages.
High load capacity, re-lubrication options, and patented designs.

RBC[®]
BEARINGS

RBC Division

www.rbcbearings.com
800.390.3300

RBC has had a long tradition of innovation, commitment, and quality since the company was founded in 1919. Today, RBC has grown into a world-class manufacturer of standard and custom-engineered bearings and related products, with a product focus on research, testing, and development of the best product for specific applications.

What We Manufacture

RBC Bearings, with divisions throughout the United States and Europe, provides bearings and precision products for applications in the construction, mining, material handling, transportation and off-highway equipment, robotics and automation, farming, machine tool, and semiconductor equipment industries. Through RBC Aerospace Bearings, the company is a major manufacturer of standard and special bearings and precision products for military and commercial aerospace applications.

RBC's high-quality bearings include:

- **Spherical Plain Bearings** - Radial, angular, contact, high misalignment, extended inner ring, QuadLube® long life bearings, ImpactTuff® case carburized bearings, ShimPack® double-acting angular contact bearings, CrossLube® lubrication groove systems, SpreadLock® Seal, Fibriloid® self-lubricating bearings, and MillTuff® 3-part bearings.
- **Cam Followers and Yoke Rollers** - Standard stud, heavy stud, yoke type, caged roller followers, RBC Roller® long life cam followers, HexLube® universal cam followers, airframe track rollers. Mastguide rollers and carriage rollers, chain sheaves (for leaf chain), toothless sprockets (for roller chain), and heavy-duty roller bearing construction.
- **Heavy Duty Needle Roller Bearings** - Pitchlign® caged heavy duty needle roller bearings, inner rings, type TJ TandemRoller® bearings for long life.
- **Rod Ends** - Commercial and aerospace, precision, Mil-Spec series, self-lubricating, inch and metric. Heim Unibal® and Spherco®.
- **Self-Lubricating Bearings** - Radial, thrust, rod ends, spherical plain bearings, high temperature, high loads, inch and metric. Fiberglide®.
- **Thin Section Ball Bearings** - Standard cross sections to one inch. Sizes to 40 inches. Stainless steel and other materials available. Seals available on all sizes and standard cross sections.
- **Airframe Control Bearings** - Ball bearing types, self-lubricating types, needle roller track rollers.
- **Ground, Semiground, and Unground Ball Bearings** - Full complement, utilizes design and burnished races for higher loads, long life, and smooth operation.
- **Pins and Shafts** - All types of pins, needles, shafts, and rollers.
- **Tapered Roller Bearings** - Case hardened in a variety of sizes, used in Class 8 heavy truck and trailer wheel bearings, final drive transmissions and gear boxes.
- **Custom Designed Bearings** - RBC produces a wide range of custom bearings in various materials for specific applications.

RBC Spherical Plain Bearings

RBC has been a pioneer in spherical plain bearing technology since inventing the fractured outer race design many years ago. Since that time, RBC has continued to introduce industry leading innovations such as high misalignment, angular contact, extended inner ring, tapered bore, and extended lubrication groove spherical plain bearing designs.

These advanced products are used wherever pivoting, high load bearing applications are found. Most typically, RBC spherical plain bearings are employed in hydraulic cylinder rod ends, vehicle suspensions, heavy equipment articulated joints, and other severe duty uses.

Industries served include off-highway mobile construction equipment, large agricultural machinery, mining equipment, forestry products, and other large equipment requiring bearings that provide misalignment capabilities while carrying high loads.

Unique spherical plain bearing products offered include:

- **QuadLube®** - Long life bearings incorporating patented lubrication feature that provides lubrication directly in the bearing load zone.
- **ImpactTuff®** - Case carburized bearings that are ideal for use in high impact applications. Two U.S. patents cover this technology.
- **ShimPack®** - Double acting angular contacting plain bearings offer the unique feature of adjustable and factory pre-set radial clearance tailored to each unique application.
- **CrossLube®** - Lubrication groove systems that deliver exceptionally high lubricant volumes for use in extended duty applications where re-lubing is difficult.
- **SpreadLock® Seal** - Unique in the industry. These patent pending seals utilize opposing contact lips, low profile cross-section, and unique materials for top performance.
- **Fibriloid®** - Maintenance-free self-lubricating bearings are available only from RBC. They utilize a state-of-the-art liner system developed by RBC's Transport Dynamics Division.
- **MillTuff®** - 3-part spherical plain bearing designed specifically for use in steel mill continuous casting machine roll assemblies.

How We Can Serve You

RBC has implemented a total quality control system that uses statistical quality control at all facilities, and manufactures in high volume to a just-in-time program.

To serve the ongoing needs of customers, RBC has a network of over 1,600 distributors and sales engineers throughout the US, Europe, and South America, with authorized agents worldwide. For assistance with your bearing application, contact:

Customer Service - 800.390.3300

Warranty

RBC products are warranted for material and workmanship for a period not to exceed one year from shipment and for a value not to exceed purchase price. No other warranty is in effect.

RADIAL TYPE SPHERICAL PLAIN BEARINGS STANDARD SERIES

B-L and MB- SERIES

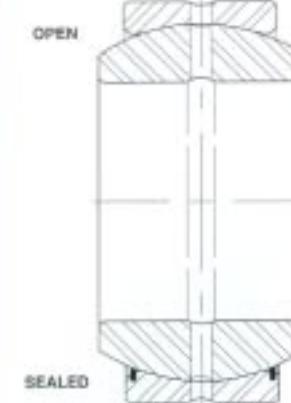

Designed to support heavy radial loads under misalignment. These bearings also possess moderate thrust loading capability. They are non-separable with a single fractured outer ring, and are available in open or sealed designs and inch or metric sizes.

B-EL and MB-E SERIES

With an extended inner ring, the need for additional locational spacers is eliminated. The inner ring bore is relieved to prevent excess bending stress. Available in open or sealed designs and inch or metric sizes.

BH-L and MBH- SERIES

Due to greater inner ring cross section, the BH-L and MBH series is capable of greater misalignment. Available in open or sealed designs and inch or metric sizes.

RADIAL TYPE SPHERICAL PLAIN BEARINGS EXTENDED LIFE SERIES

B-LSSQ and MB-SSQ SERIES

Up to 300% improved service life provided by innovative lubrication system. The patented system distributes lubrication to the load zone even when no load reversal exists and allows re-lubrication without removing the load. These bearings provide an increased life to many problem applications. Available in inch or metric sizes.

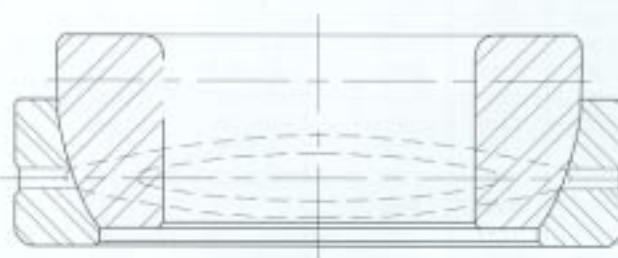

B-LFSS and MB-FSS SERIES

Fibriloid™ self-lubricated liner on the outer ring bore delivers high load carrying benefits combined with extended life capabilities. These bearings are ideal for applications in which re-lubrication is impractical or impossible, but longevity is a must. Available in inch or metric sizes.

ANGULAR CONTACT SPHERICAL PLAIN BEARINGS

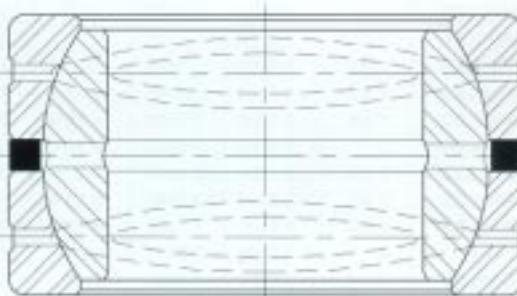

B-SA and MB-SA SERIES

B-SA Single Acting Angular Contact

Designed to support heavy unidirectional thrust and combination radial/thrust loads. Elliptical lubricating grooves are a standard feature. Available in both inch or metric sizes.

B-DSA-3 and MB-DSA3 SERIES

B-DSA-3 SHIMPACK Double Acting Angular Contact

B-DSA-3 series bearings can support radial and thrust loads in both directions. They are commonly used in articulating joint applications. Tapered bore designs are available, as well as inch or metric sizes.

PLAIN BEARINGS, ROD ENDS and SPECIALS

Hardened and Precision Ground Steel Bushings are available for applications that would see costly wear in the housing or on the shaft and where no misalignment occurs. They are supplied with or without oil holes and grooves and with various oil groove configurations.

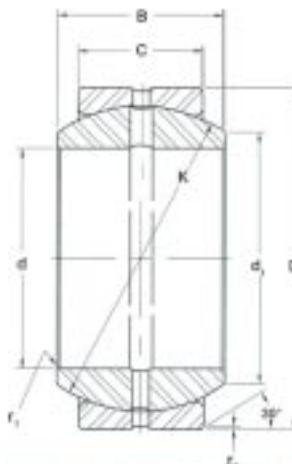

Industrial Rod Ends can be supplied with any style radial spherical plain bearing. RBC Rod Ends are available with a male or female shank.

Standard Radial Outer Rings are the outer rings from the standard inch and metric spherical plain bearing offering. They can be used whenever the user provides the inner ring or ball stud.

Special Spherical Plain Bearings are available for custom requirements. Unique fractures, nonstandard envelopes, various degrees of metallurgical hardness as well as unique coatings and sealing arrangements have been developed for specific needs. RBC's experienced team of engineers is available for consultation for your unique requirements.

All dimensions are in inches.

Outer rings of bearings size 72 and above are double fractured (suffix-9L).

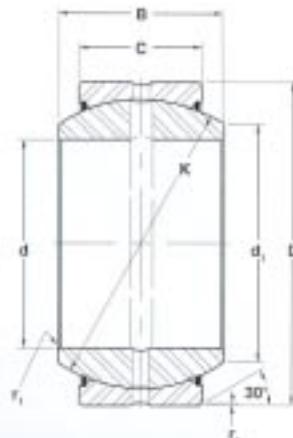

Bore dimensions apply after MoS₂ coating. All other dimensions are before coating.

① Applies only to bearings without seals. Use 7 degrees for sealed bearing.

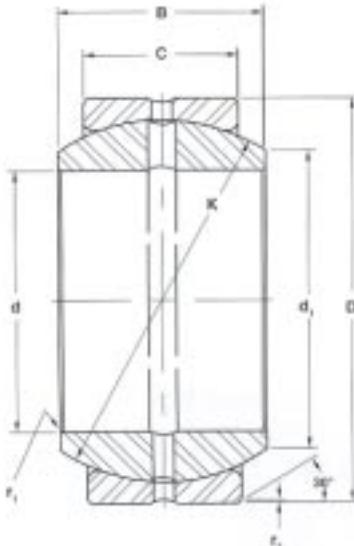

② Ultimate static and impact loads should not exceed 150% of catalog ratings.

③ See technical section for alternate housing diameter recommendations.

④ Housing fillet $r_2=0.015^{\circ}$ for bearings with seals.

① Applies only to bearings without seals. Use 4 degrees for sealed bearings.

② To obtain weight in pounds, multiply by 0.22482 (lb/N).

③ See technical section for alternate housing diameter recommendations.

FEATURED PRODUCT

The RBC QUADLUBE™ Long Life Spherical Plain Bearing

Tough applications in construction and material handling requires a spherical plain bearing with longer life, less maintenance and less downtime than standard spherical plain bearings. A bearing with total interchangeability to standard designs is preferred. RBC Engineering developed and patented* the QUADLUBE™ spherical plain bearing after observing the three predominant factors which contribute to the failure of spherical plain bearings:

- 1) Unidirectional loads**
- 2) Heavy loads**
- 3) Neglected lubrication intervals**

Each factor contributes to a lack of lubrication in the load zone area which eventually allows for metal to metal contact and premature failure of the bearing in the application.

RBC Engineering developed and patented the QUADLUBE™ Spherical Plain Bearing to solve each of these three failure modes. The RBC QUADLUBE™ long life spherical plain bearing is manufactured within the same envelope dimensions as standard inch and metric spherical plain bearings. The patented lubrication system contains four precisely machined circular grooves on the spherical surface of the inner ring. Each circular groove is connected by a lubrication groove around the circumference of the inner ring. The bearing is packed with an EP moly grease and is sealed with lip contacts seals for grease retention.

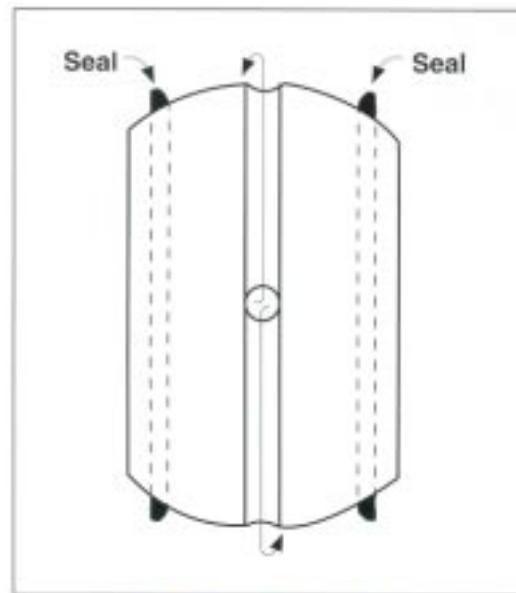

Industry Applications for QUADLUBE™

- **Construction Equipment**
- **Mining Machinery**
- **Lift Trucks and Material Handling Equipment**
- **Log Skidders**
- **Off-Highway Vehicles**
- **Satellite Dishes**

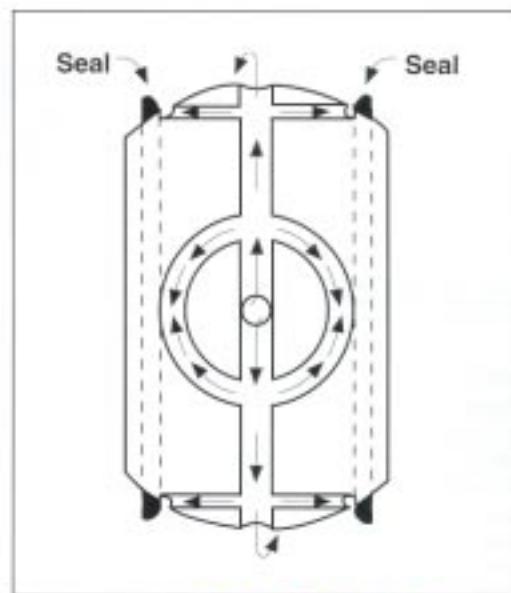

*US Patent Number 4785757, German Patent Number 38 18 633

FEATURED PRODUCT

The RBC QUADLUBE™ Long Life Spherical Plain Bearing **Lubrication Flow**

**Conventional
Spherical Plain Bearing**

**RBC QUADLUBE™
Spherical Plain Bearing**

The innovative design of the RBC QUADLUBE™ interconnecting lubricating groove system ensures a more efficient distribution of the lubricant by providing channels that transport the grease throughout the entire bearing, including into the contact area of the bearing under load. In cases of unidirectional load or when lubrication intervals are missed, the groove system retains extra lubricant where it is needed for added margin of performance. In the dirtiest of environments the grooves and channels capture any dirt or debris and keep these contaminants away from the raceway surfaces.

The RBC QUADLUBE™ long life spherical plain bearing maintains the same size capacity ratings as conventional bearings with the same envelope. They can immediately replace conventional bearings without modifying housings or shafts. Should you have a nonstandard spherical plain bearing in your problem application, RBC can design a QUADLUBE™ bearing specifically for your existing envelope sizes.

All dimensions are in inches.

Outer rings of bearings size 72 and above are double fractured (suffix-9L).

Bore dimensions apply after MoS₂ coating. All other dimensions are before coating.

All dimensions are in inches.

Outer rings of bearings size 72 and above are double fractured (suffix-9L).

Bore dimensions apply after MoS₂ coating. All other dimensions are before coating.

- ① The nominal bore diameter is measured at the inner ring center.
- ② Applies only to bearings without seals. Use 9 degrees for sealed bearings.
- ③ Ultimate static and impact loads should not exceed 150% of catalog ratings.
- ④ See technical section for alternate housing diameter recommendations.
- ⑤ Higher clamping forces reduce bearing clearance.

① To obtain weight in pounds, multiply by 0.22482 (lb/N).

② See technical section for alternate housing diameter recommendations.

FEATURED PRODUCT

The RBC Self-Lubricated, Fibriloid™ Lined Spherical Plain Bearing

THE BEARING

Standard steel on steel spherical plain bearings require periodic lubrication and maintenance to replenish the lubricant between the sliding surfaces and to flush out debris and contaminants. With self-lubricating, Fibriloid™ lined bearings, there is no need for supplemental lubrication or re-lubrication. PTFE is a polymer in Fibriloid™ whose properties include lubrication capability. In proper form, PTFE is more than just a lubricant as it can withstand wear and is resistant to cold flow.

This RBC "maintenance-free" bearing consists of a one piece swaged outer ring, a hardened, chrome plated inner ring and the state of the art, Fibriloid™ PTFE liner system. Parts over 7" inside diameter incorporate a double fractured outer ring. The bearing is sealed with lip contact seals to protect the liner from outside contaminants. It is offered in standard inch or metric sizes and can be designed for special envelopes if required.

THE LINER SYSTEM

The Fibriloid™ liner was originally developed by RBC's Transport Dynamics Division for use in fixed wing aircraft. Transport Dynamics Division was the original patent and license holder for self lubricated bearing liner systems and continues to be the industry leader today. Fibriloid™ is recognized as the strongest and most fatigue resistant bearing liner in the industry. It represents a significant advance in the evolution of composite liner systems and offers new opportunities in applications that were judged borderline or beyond the capabilities of previous liner systems.

HOW THE FIBRILOID™ SYSTEM WORKS IN THE RBC SELF-LUBRICATED BEARING

In a new bearing, when the chrome plated inner ring is moved relative to the liner, the inner ring picks up PTFE from the liner. Under combination of pressure and movement, the "picked up" PTFE is burnished into the metal and liner surfaces, decreasing the coefficient of friction. After the coefficient of friction becomes sufficiently low, additional PTFE can no longer be sheared from the liner and no further PTFE will be deposited. Through continued use, some of the PTFE on the surfaces may exit the bearing. As this occurs, the increased friction will cause more PTFE to mechanically shear from the liner until equilibrium is once again reached.

FEATURED PRODUCT

The RBC Self-Lubricated, FibriloidTM Lined Spherical Plain Bearing

The FibriloidTM liner system is a unique fabric consisting of a special weave of TEFLONTM and NomexTM fibers bonded by a proprietary formulation of stable phenolic resins. The weave of the fabric incorporates NomexTM (N) thread bundles in one direction and a compound thread of NomexTM and TEFLONTM (TN) in the crossing thread. Advantages of this state of the art system versus earlier generation liner systems include:

- Very Low Wear rates at High PSI Loads
- Excellent High Temperature performance capability
- High static Strength and increased Stiffness
- Improved Resistance to a variety of Fluids encountered in various applications

The NomexTM fibers provide the capability to withstand higher temperatures and load that previously were not possible with Dacron or Fiberglass.

THE RBC ADVANTAGE

The benefits of a hardened spherical plain bearing and a high load carrying, self-lubricating liner system are now combined into one product. This is the most advanced maintenance - free bearing on the market.

All dimensions are in millimeters.

Outer rings of bearings size 180 and above are double fractured (suffix-9LFSS).

Tilt angle 5 degrees.

① No lubrication grooves and holes in outer ring.

② Ultimate static and impact loads should not exceed 150% of catalog ratings.

③ See technical section for alternate housing diameter recommendations.

^① To obtain weight in pounds, multiply by 0.22482 (lb/N).

^② To obtain capacity in pounds, multiply by 224.82 (lb/kN).

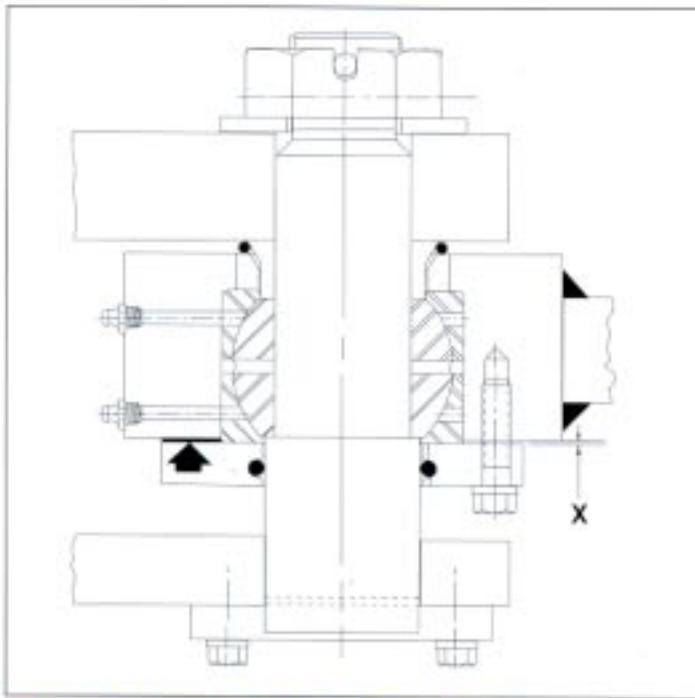

^③ See technical section for alternate housing diameter recommendations.

FEATURED PRODUCT

The RBC SHIM PACK™ B-DSA-3 Double Acting Angular Contact Spherical Plain Bearing

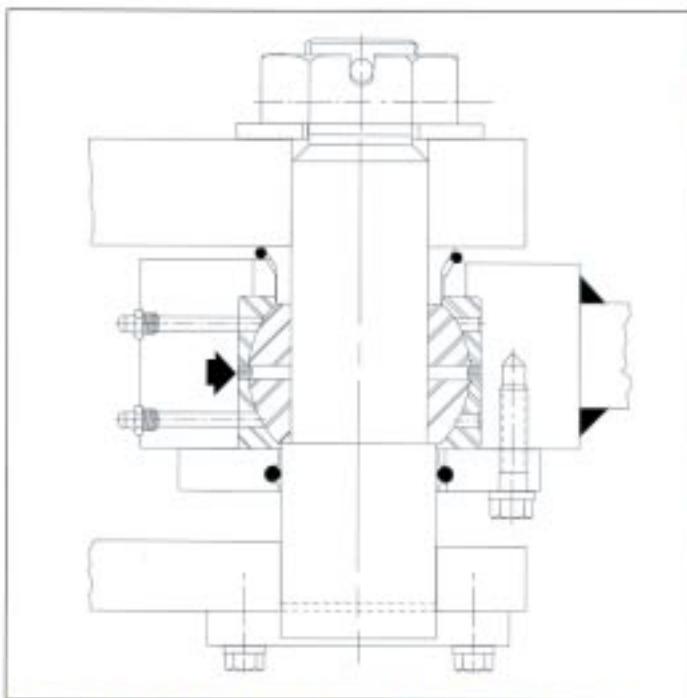

The RBC SHIM PACK™ was developed to ease the installation procedures required on the assembly line. Traditionally the bearing assembly was completed, clearance was measured and then the assembly was disassembled, shimmed and reassembled. With the RBC SHIM PACK, a spacer is preset and individually calibrated at the factory to provide the optimum amount of axial internal clearance.

Old Method of Shimming

The cover plate has to be bolted down until all clearance in the bearing is eliminated and gap X measured. The cover plate is then removed and shims added. The housing begins to fret and deteriorate as the outer ring slides because of the loose fit.

The B-DSA-3 Shim Pack Bearing

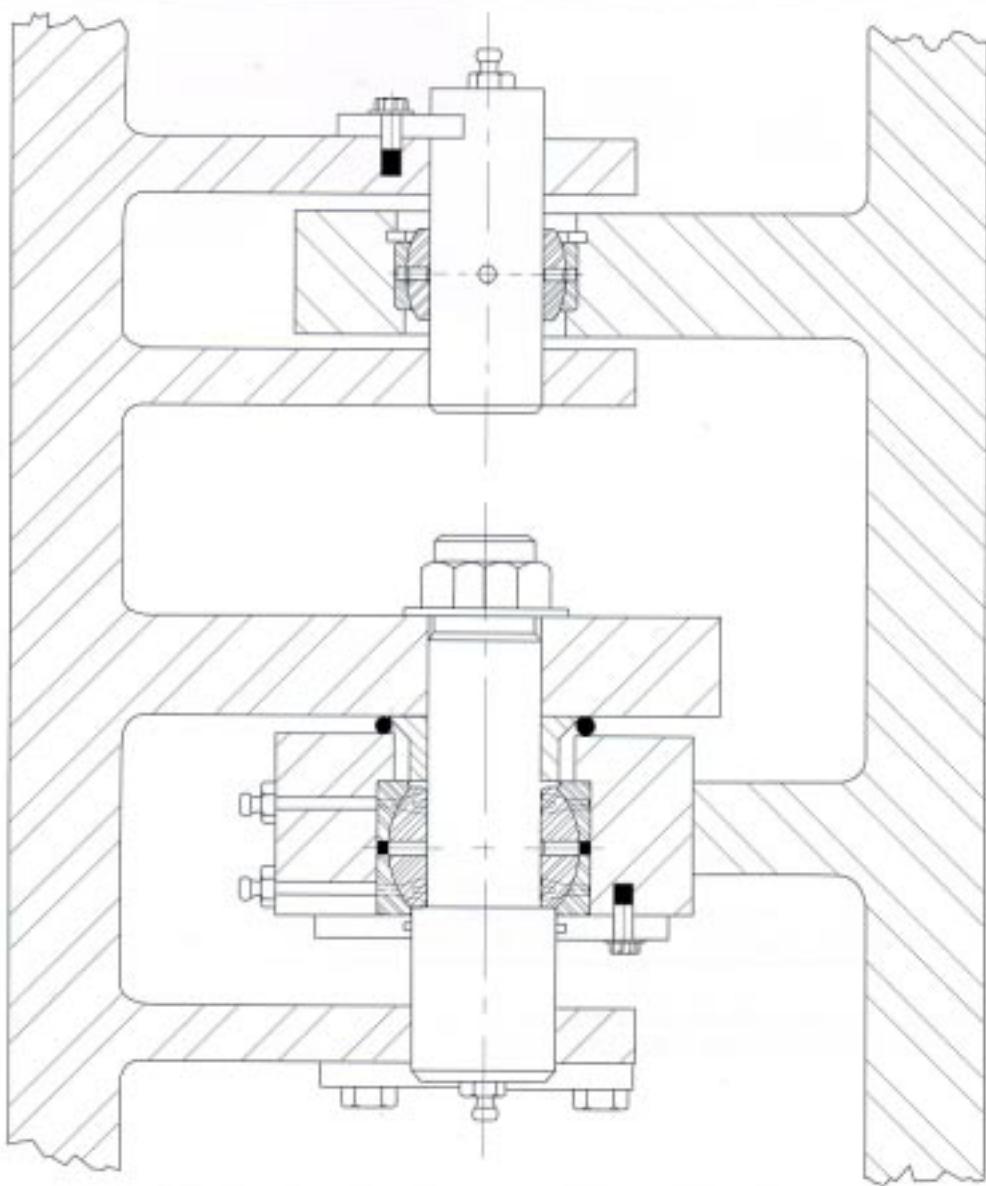

The bearing is mounted with a press fit and cover plate installed. The proper amount of clearance is already preset into the bearing at the factory. As the outer ring is press fit and axially clamped, it will not rotate and damage the housing.

The RBC SHIM PACK design eliminates the sliding fit and allows a press fit of the outer ring. As the required clearance is determined by RBC application engineers and set at the RBC factory, consistency is maintained from size to size and bearing to bearing. The customer simply installs the RBC Shim Pack as he would any other self-aligning spherical plain bearing, with no need of concern as to the axial clearance or press fit of the outer ring.

FEATURED PRODUCT

The RBC SHIM PACK™ in an Articulated Joint

The use of the RBC SHIM PACK™ in articulated joints in place of a tapered roller bearing offers many advantages. The misalignment capable B-DSA-3 design means that costly line boring is no longer necessary. Alignment becomes less critical allowing the relaxation of bore tolerances and an easier assembly. Assembly also becomes easier as axial clearance no longer has to be set during installation. Dirt and water, which would destroy a roller bearing, are more easily tolerated with the B-DSA-3 design. Misalignment from shaft and housing bore wear have less effect on the RBC SHIM PACK™ than on a roller bearing as contact geometry is critical to successful roller bearing operation.

Like all RBC Spherical Plain Bearings, the RBC SHIM PACK™ is made to withstand the harsh environment seen by off-highway vehicles. The B-DSA-3 design is much more tolerant than tapered roller bearings to rough conditions and seal damage. Overloads and shock loads which lead to early failure in tapered roller bearings are better tolerated by the RBC SHIM PACK™ design. The RBC SHIM PACK™ is the bearing *designed specifically* for articulating joint applications.

All dimensions are in inches.

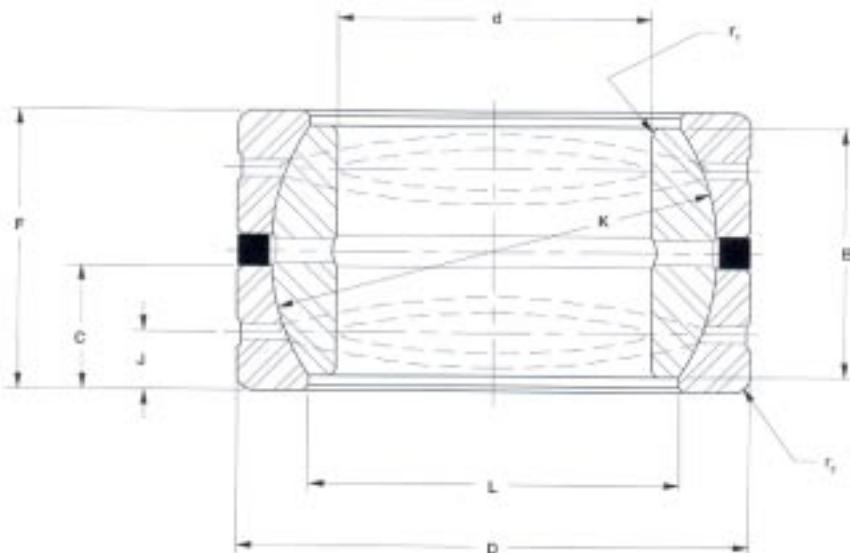

Bore dimensions are after MoS₂ coating. All other dimensions are before coating.

For bearings with grooves extended to the face of the outer ring at two places, add suffix "-1" e.g. BT3236DSA3-1.

^①The nominal bore diameter is measured at the inner ring center.

^②Clearance after shim pack compression.

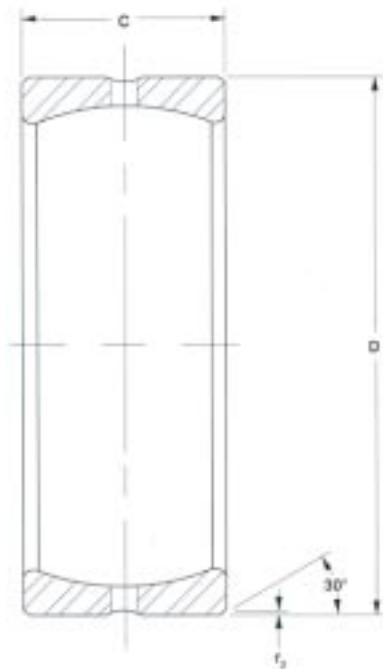

^③Ultimate static and impact loads should not exceed 150% of catalog rating.

^④Excessive clamping forces will cause loss of bearing clearance.

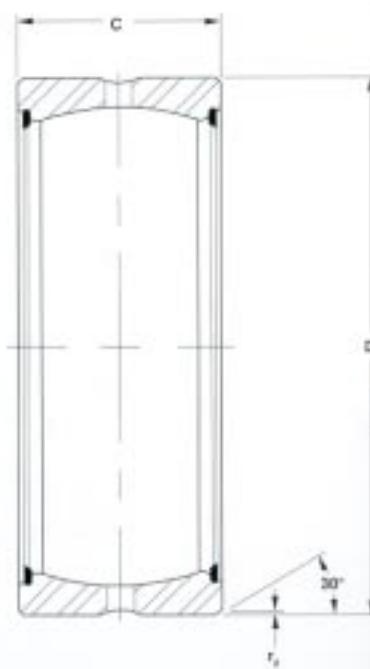

^⑤Contact RBC Engineering in cases where operating thrust load exceeds inner ring clamping force.

① For sealed bearings with extended inner ring use 5 degrees.

② To order left handed thread, add suffix "L" to part number shown in chart (e.g. REF 12L).

① For sealed bearings with extended inner ring use 5 degrees.

② To order left handed thread, add suffix "L" to part number shown in chart (e.g. REM 12L).

SPHERICAL PLAIN BEARING ENGINEERING

Basic Radial Bearing Design

Spherical Plain Bearings have spherical contact surfaces which permit the inner ring to rotate freely in all directions within bearing and application design constraints. This gives them the capability to self-align, which means, for example, to adjust automatically to misalignment stemming from inaccurate machining, frame distortions from welding, or deformations of pin and frame due to static and dynamic forces. Such misalignment would generate considerable end loading and cause early failure of plain cylindrical sleeve bearings. Thus spherical plain bearings are thought to have their origin as replacement for plain cylindrical sleeve bearings or bushings and are still occasionally called ball bushings.

The first modern radial spherical plain bearing had a non-fractured outer ring with a loading slot slightly wider than the inner ring width (figure 1). Such a bearing can easily be assembled and disassembled simply by rotating the inner ring 90 deg out of plane to where it fits through the loading slot. Because the loading slots take away a significant portion of the contact area, radial and thrust capacity in the direction of the loading slots are affected. The bearing is sensitive to the orientation of the loading slots with respect to the main load direction. Lubricating with grease is problematic. It may be lost prematurely by escaping through the loading slots. Yet, this type of bearing is still made today for applications where the outer ring cannot be fractured, either because the outer ring material is too soft for fracturing, or because of application requirements which cannot tolerate a fractured outer ring.

Figure 1: Outer Ring with Loading Slots

The loading slot bearing eventually evolved into a bearing with a fractured outer ring. Initially, outer rings were double fractured, followed later by a single fractured design. Both designs get by without a loading slot and are insensitive to the orientation of the fracture plane with respect to the load direction as long as the outer ring maintains a press fit inside a sufficiently rigid housing bore. A double fractured outer ring consists essentially of two segments of approximately equal size and a means of holding the bearing assembly together (figure 2). After pressing the bearing into a housing bore, the fractured surfaces of the two outer ring halves interlock perfectly. The fracture line cannot be felt. It follows that outer ring halves cannot be interchanged among bearings and must not be inadvertently rotated 180° out of position.

Figure 2: Double Fractured Outer Ring

The Patented RBC Single Fracture Design

The requirement to keep outer ring halves together and properly aligned eventually spawned the single fracture design. This patented RBC feature is the industry standard today. After being fractured at a single point on its circumference, the outer ring is still a single piece (figure 3). To assemble the inner ring, the outer ring must be spread open far enough to let the inner ring pass through.

The plane of fracture is 90 deg from the lubricating holes for both single and double fractured outer rings.

*Note: The fracture in the outer ring is intentional.
It is not an indication of a defective bearing.*

Figure 3: Single Fractured Outer Ring

In typical applications, spherical plain bearings support heavy static loads allowing for initial misalignment. Dynamic applications are limited to slow oscillations and rotations below the recommended maximum *pv*-value (pressure×velocity). The *pv*-value is used to measure the amount of heat generated by the bearing. Spherical plain bearings can operate above the recommended *pv*-value, but only under special lubrication conditions.

Metric spherical plain bearings have evolved differently from inch dimensional bearings, not just in their geometry, but also in their load ratings. For comparable inner ring bores, metric bearings have a smaller outside diameter and a smaller width, but by convention, their permissible static contact pressure is higher. (See section LOAD RATING).

More Radial Bearing Designs

RBC QUADLUBE™ Design

With few exceptions, steel-on-steel spherical plain bearings used in dynamic applications must be relubricated periodically. To be effective, the grease must penetrate into the contact area between inner and outer ring. If a bearing is subject to a unidirectional load, it must be unloaded during relubrication or only a minimal amount of grease will ever reach the contact area. Most of the lubricant will accumulate in the unloaded zone and eventually exit without benefiting the bearing service life.

The patented QUADLUBE™ design solves the lubricant flow problem of bearings where the load acts always in the same direction. The additional circular grooves on the spherical diameter of the inner ring allow grease to flow into the contact area even with the bearing under load. The grooves help to collect wear debris which is purged from the bearing during a subsequent relubrication cycle.

Heavy Section

In a typical bearing application, the inner ring mounts on a shaft and its face abuts against a shoulder. If the bearing must support significant thrust loads, the shoulder diameter should match the outside diameter of the inner ring at the face to minimize contact pressure. See the catalog pages for this dimension. A tilting outer ring will eventually make contact with this shaft shoulder, which defines the bearings maximum tilt angle (figure 4).

CAUTION: The actual tilt angle of a bearing assembly may be limited by the design of surrounding components.

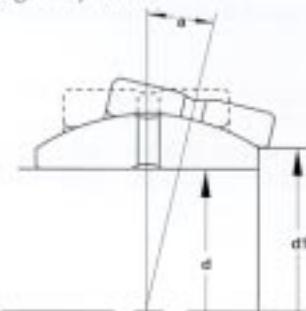

Figure 4: Maximum Tilt Angle

To increase the tilt angle of a standard bearing, the width of the inner ring must be increased. But simply increasing the width is not sufficient because there would be no inner ring face left if we did not also reduce the inside diameter of the inner ring. These inner rings with greater width and wall thickness form the heavy section series BH-L (figure 5). For a given shaft size, the heavy section bearings have greater misalignment capabilities and a greater load carrying capacity compared to the standard series at the cost of increased overall dimensions.

Figure 5: Standard vs. Heavy Section Inner Ring

Tapered Bore Inner Rings

Bearings with heavy section inner rings are also available with a tapered bore, see series BT-L (figure 6). The taper is 1:8 or 1.5° per ft on diameter. There are 2 main reasons for using a tapered bore bearing:

- To prevent rotation between inner ring bore and shaft.
- To control the diametral clearance of the bearing assembly. As the inner ring is forced up the tapered pin, its outside diameter expands effectively reducing the diametral clearance.

CAUTION: Reducing the operating clearance below 0.001" (0.025mm) may increase bearing friction and wear rate. A substantial thrust force in the direction of the large end of the taper may cause additional inner ring expansion which could lock up the bearing.

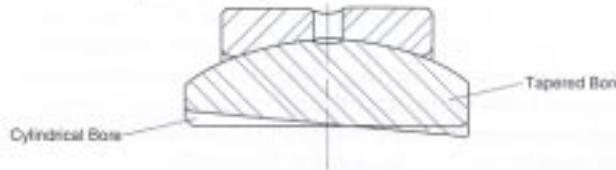

Figure 6: Heavy Section Inner Ring
Cylindrical vs. Tapered Bore

Extended Inner Rings

For applications with substantial outer ring tilt, for example yoke supported rod ends of some hydraulic cylinders, RBC offers radial bearings with extended inner rings (figure 7). Using a bearing with an extended inner ring obviates the need to add separate spacers to the bearing assembly to create the axial space required by the outer ring housing.

CAUTION: Spacers and inner ring extensions increase the distance between pin supports. At high loads, pin deflection may become a problem.

Figure 7: Standard vs. Extended Inner Ring

Maintenance-Free Bearings

RBC offers maintenance-free bearings consisting of a chromium plated inner ring, an outer ring with a bonded, Fibriloid™ Teflon liner, and seals. The liner provides excellent load bearing capacity and a low wear rate (figure 8).

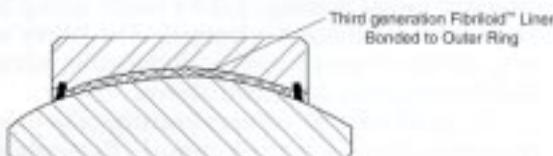

Figure 8: Maintenance-Free Bearings

Sealed Bearings

Except for the very small sizes, all radial spherical plain bearings can be ordered with integral seals. Their function is twofold, retain the lubricant as much as possible inside the bearing and slow the ingress of contaminants. Rubber or plastic seals work best in bearings which experience circumferential motion or very frequent tilting, which tends to keep the contact surfaces clean. The seals are not effective at scraping off paint or accumulated and hardened dirt during an occasional tilting motion.

Angular Contact Bearings

Single Acting

Angular contact bearings, RBC series B-SA, are intended for applications with thrust loads exceeding the capability of a radial bearing. Angular contact bearings can support both radial and thrust loads. Single acting bearings are separable and support thrust loads in only one direction (figure 9). To support heavy thrust loads in both directions, use either 2 single acting bearings mounted in an "O" or "X" configuration (figure 10) or consider a double acting bearing, see below. Angular contact bearings do not have the misalignment capabilities of radial bearings, in fact, the angle of misalignment is generally quite small.

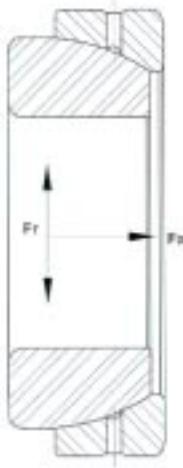

Figure 9: Angular Contact Bearing, Single Acting.
Permissible Load Directions

Double Acting

Combining two single acting angular contact bearings into a singular unit yields a double acting bearing with a heavy section inner ring, the RBC series B-DSA3 (figure 11). This type of bearing is often used as a locating bearing because it can support much heavier thrust loads than a standard radial bearing. Like a single acting bearing its angle of misalignment is limited. The heavy section inner ring allows a tapered bore with the same advantages and disadvantages as described above.

As in all angular contact bearings, the proper axial clearance after assembly is critical. To eliminate the need for external shims, RBC produces these bearing assemblies

CAUTION: 2 single acting angular contact bearings mounted in an "X" configuration a fair distance apart may bind if there is an appreciable temperature difference between shaft and housing. Allow for thermal expansion or use "O" configuration.

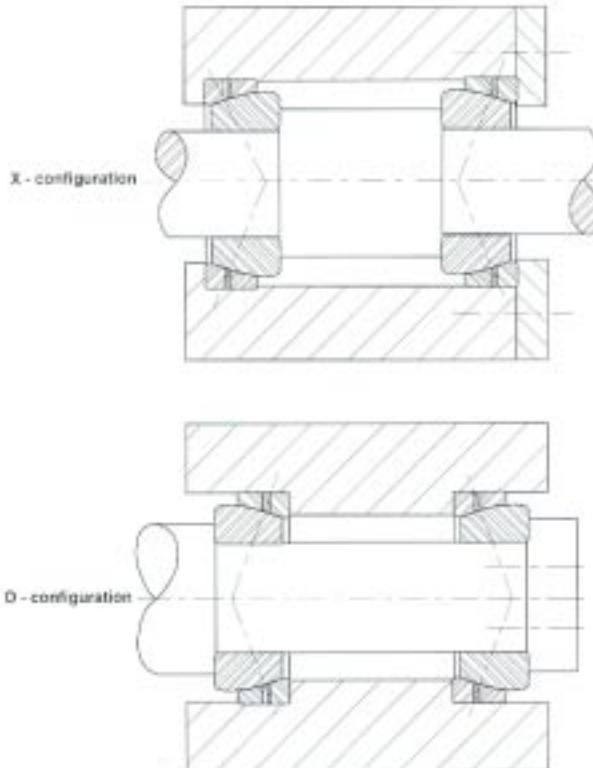

Figure 10: Bearing Arrangement

with an axial clearance preset at the factory. A shim pack inserted between the two outer rings determines the actual clearance. The thickness of this shim pack may differ from one bearing assembly to the next, therefore care must be taken not to mix components from different assemblies. The ties of each bearing should only be cut immediately before installation.

CAUTION: Do not interchange components of Shimpack™ Bearings.

The shimpack spacer is an elastic component. To prevent excessive elastic or plastic deformations, the catalog pages list a recommended shim pack compression force (figure 12). Such a compression force could be generated by an end plate being tightened down with a number of bolts. As long as the clamping force does not exceed the recommended shim pack compression force, the listed axial bearing clearance will be maintained. Clamping beyond that limit will start to plastically deform the shimpack spacer and reduce the axial bearing clearance accordingly. Unless such an effect is actually intended, the assembly instructions should specify a maximum tightening torque for the bolts.

CAUTION: Observe the maximum recommended shimpack compression force.

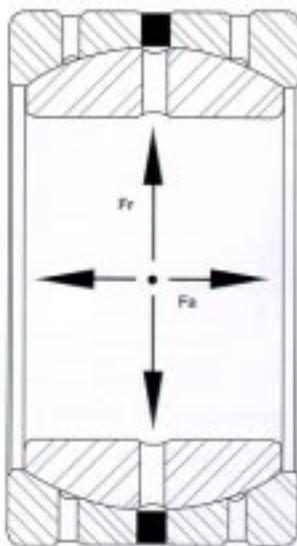

Figure 11: Angular Contact Bearing, Double Acting. Permissible Load Directions.

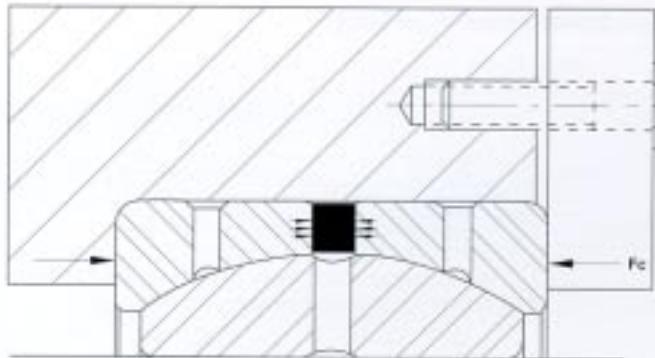

Figure 12: Shimpact Compression Force=F_c

Material and Specifications

Inner and outer rings are manufactured from through hardened bearing quality steel per ASTM A485, and, unless otherwise specified, heat treated to HRc 57 minimum for optimum wear resistance. The spherical contact surfaces are precision ground. Inner and outer rings are phosphate treated prior to coating with a dry film lubricant (MoS₂).

The inch and metric radial bearings described in this catalog meet the requirements of series 3 of ANSI/ABMA Std 22.

Except for the larger sizes, the outer rings of radial bearings are single fractured which allows assembly of the inner ring. Larger bearing sizes have double fractured outer rings and can be disassembled if necessary. These bearings carry the suffix -9L. The fractured rings may be slightly out-of-round in the free state, but will round up when mounted in a proper housing bore. It is generally not necessary to orient the fracture plane relative to the load direction.

Load Ratings

Both inch and metric bearings consist of the same high quality, high strength bearing steel, with a strength of material of 285,000 to 300,000 psi [1965 to 2069 MPa].

In most applications the bearings are mated with shafts and housings made of lower strength steel, which makes it impossible to realize a contact stress level approaching this magnitude. For practical purposes, the bearings must be down rated to a level where they can safely work with lower strength mating components. (See also sections on housing design, shaft design, typical failure modes). Applications with loads in excess of the recommended load limits are possible but should be reviewed by RBC Engineering.

By convention, the permissible contact stress has been defined differently for metric and inch dimensional bearings. The definitions given apply to radial bearings, they are similar for other bearing types.

A) Inch Dimensional Bearings

The maximum recommended static contact pressure is 50,000 psi [345 MPa]. The maximum recommended dynamic contact pressure is 25% of that or 12,500 psi [86 MPa].

The radial and thrust ratings are based on the projected area and can be derived with the following equations:

$$C_o = 50,000 \cdot K \cdot C \cdot f_r$$

$$C_{OA} = 35,000 \cdot (K^2 - f_{\alpha} \cdot (K^2 - C^2)) \cdot (\pi/4)$$

C_o = recommended static radial load limit [lbf]

C_{OA} = recommended static axial load limit [lbf]

K = spherical diameter [in]

C = outer ring width [in]

f_r = geometry factor, typically $f_r = 0.7$. Makes allowance for lube grooves & undercuts.

f_{α} = geometry factor,

$f_{\alpha} = 1.17$ approx., for single fractured,

$f_{\alpha} = 1.04$ approx., for double fractured bearings

B) Metric Bearings

The static radial load limit is given at a pressure of 430 MPa [62,370 psi]. The maximum recommended dynamic contact pressure is 20% of that or 86 MPa [12,470 psi]. The static thrust load limit is based on a contact pressure of 215 MPa [31,185 psi]. No allowance is made to account for the effects of lubricating groove and undercuts. The equations are then:

$$C_o = 430 \cdot K \cdot C / 1000 \text{ [kN]}$$

$$C_{OA} = 215 \cdot C^2 \cdot (\pi/4) / 1000 \text{ [kN]}$$

C_o = recommended static radial load limit [kN]

C_{OA} = recommended static axial load limit [kN]

K = spherical diameter [mm]

C = outer ring width [mm]

For comparable bearing inside diameters, e.g. 2.000" and 50mm, inch dimensional bearings typically have a somewhat larger outside diameter and considerably greater width. In this particular case, the projected gross radial contact area for the 2" bearing is 4.3125 in² (2782 mm²) compared to 2.9078 in² (1876 mm²) for the 50 mm bearing. For a given load, the inch dimensional bearing typically sees a much lower contact pressure but requires more mounting space.

Working Loads

STATIC - The static load limits given in the tables are safe bearing operating loads, provided housing and shaft are sufficiently rigid to prevent excessive deformation. The safety factor against static fracture is greater than 1.5. See the sections on shaft and housing designs to check for conditions which could require reducing the bearing load.

DYNAMIC - Applications are considered to be dynamic if the bearing is subject to more than initial misalignment or an occasional oscillation. Spherical plain bearings are best suited for oscillating motion as in hydraulic cylinders.

The dynamic bearing load for grease lubrication should not exceed:

- the dynamic capacity given in the tables and
- a $p \cdot v$ value (pressure•velocity) of 10,000 psi•ft/min.

These limits do not apply to oil lubrication. To find the $p \cdot v$ -value, use the following equation:

$$p \cdot v = 46.5 \cdot [F/C_0] + K + B \cdot f \leq 10,000 \text{ psi} \cdot \text{ft/min}$$

F = dynamic radial load [lbf]
 C_0 = recommended static radial load limit [lbf]
 K = spherical diameter [in]
 B = angle of oscillation side to side [deg]
 f = frequency of oscillation [1/min]

The above equation applies to radial bearings under radial load. Please contact RBC Engineering for an estimate of service life and for other operating conditions and bearing types.

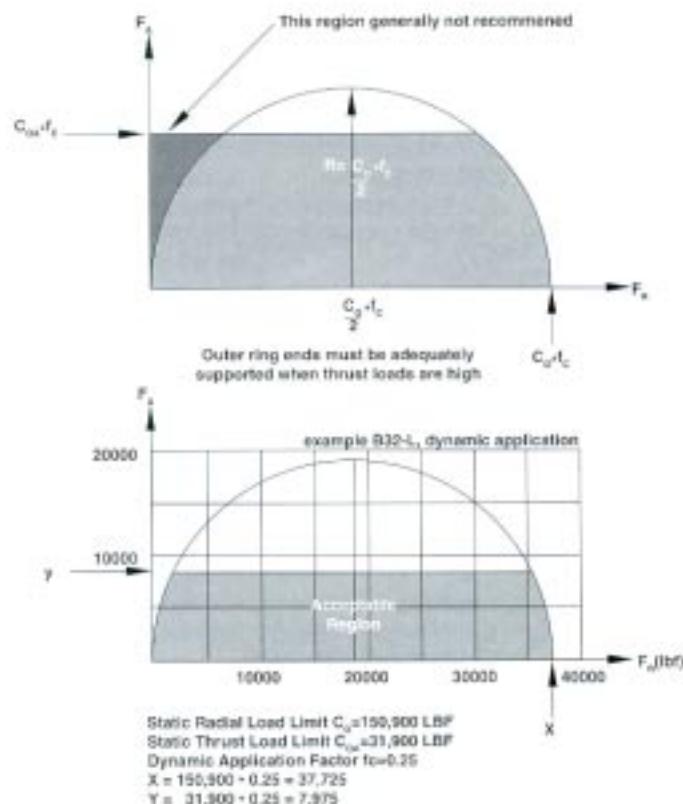

Figure 13: Radial Bearings

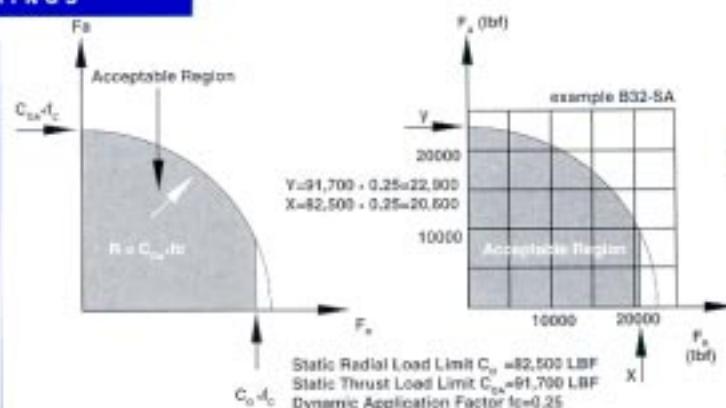

Figure 14: Angular Contact Bearings, Single Acting

COMBINATION RADIAL AND AXIAL LOADS - To determine the acceptability of a combination radial and thrust load under static and dynamic operating conditions, diagrams of acceptable regions may be constructed for radial and angular contact bearings as shown in figures 13 - 15. Any load whose radial and thrust components plot in the hatched area is permissible. The inequalities in numerical form are as follows:

Radial Bearings

$$F_r^2 + F_t^2 \leq F_r \cdot C_0 + f_c \quad \text{and} \quad F_t \leq C_{0t} + f_c$$

Angular Contact Bearings, single acting

$$F_r^2 + F_t^2 \leq C_{0A} + f_c \quad \text{and} \quad F_t \leq C_{0t} + f_c$$

Angular Contact Bearings, double acting

$$\text{If } F_r \leq (C_0 - C_{0A}) + f_c \text{ then } F_t \leq C_{0t} + f_c$$

$$\text{If } F_r > (C_0 - C_{0A}) + f_c \text{ then } (F_r - (C_0 - C_{0A}) + f_c)^2 + F_t^2 \leq (C_{0A} + f_c)^2$$

- F_r = radial load component
 F_t = thrust load component
 C_0 = static radial load limit
 C_{0A} = static thrust load limit
 f_c = 1 for static operating condition
 f_c = 0.25 dynamic operation, inch dimensional bearings
 f_c = 0.20 dynamic operation, metric bearings

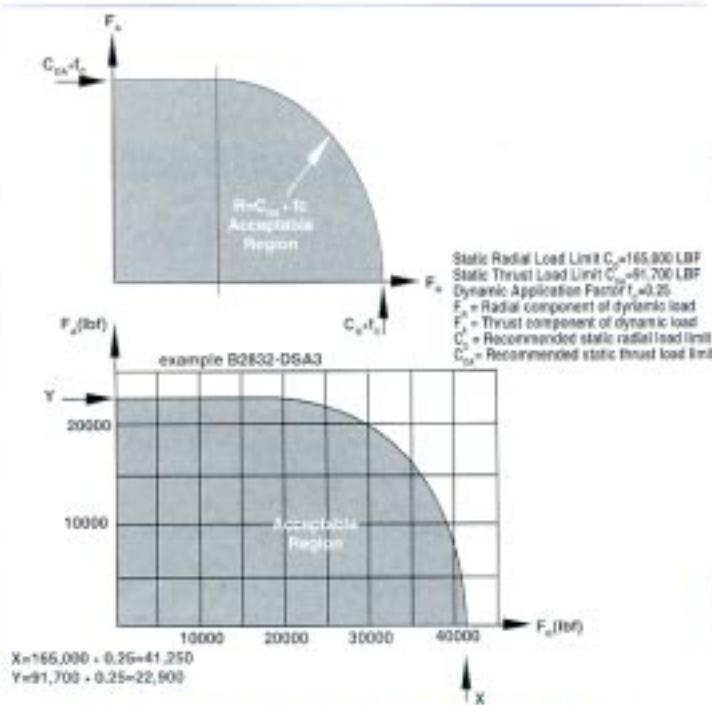

Fig. 15: Angular Contact Bearings, Double Acting

Operating Conditions

TEMPERATURE - The maximum operating temperature of sealed bearings is limited by the seal to 250 deg F. Standard bearings without seals can operate without modifications from -60 deg F to +350 deg F. For operation below -60 deg F and above +350 deg F, up to +500 deg F, it is recommended to use bearings temperature stabilized at the factory. For operation to +1000 deg F and at cryogenic temperatures, contact RBC Engineering.

ENVIRONMENT - Standard bearings are phosphate treated and coated with a dry film lubricant (MOS₂). This surface treatment provides a certain protection against corrosion from atmospheric conditions and an occasional splash. Additional protection should be supplied for operation in continuously wet environments by adding internal or external seals. RBC can supply bearings with special coatings for underwater applications.

Ingress of hard solid particles like debris, sand, grit and mud will accelerate the bearing wear and may clog lubricating holes. The bearing should be protected from exposure to solid particles.

Mounting - Fractured Outer Rings

Bearings with single or double fractured outer rings (series B-L, BH-L, MB, MBH) should be mounted with an interference fit in the housing. The interference fit corrects any out-of-roundness of the outer ring due to the fracturing process and will make the fracture line functionally invisible. For light loads of less than 20% of dynamic capacity, an ISO N7 fit may be used. RBC recommends to use an ISO R7 fit whenever possible. The internal bearing clearance can accommodate the reduced spherical diameter of the outer ring caused by an R7 press fit. An even heavier press fit may be required in applications with heavy shock loads, a rotating load on the outer ring, or when the housing is made from a light metal. In the case of heavier fits, the mounted diametral clearance must be reviewed.

Mounting - Solid Outer Rings

The bearings with non-fractured outer rings are the single and double acting angular contact series B-SA, MB-SA, B-DSA3. While the outer rings of single acting angular contact bearings may be heavily press fitted, it is often desirable to maintain axial adjustability for double acting bearings. An ISO N7 fit is still light enough to move outer rings axially in the housing bore without too great a force.

CAUTION: Outer rings of angular contact bearings subject to heavy thrust loads must not be clearance fitted.

Mounting - Inner Rings, Cylindrical Bore

It is generally recommended to press fit the inner rings where feasible to prevent rotation taking place between inner ring bore and shaft. If assembly or operating conditions require a loose fit, it is preferable to let the inner ring slide on the shaft rather than the outer ring rotate in the housing.

Mounting - Inner Rings, Tapered Bore

Heavy section inner rings of the series BT-L and BT-DSA3 feature a tapered bore with a taper of 1:8 (1.5" per ft on diameter). Tapered bores are useful to prevent inner ring rotation on the pin and to control the diametral bearing clearance by expanding the inner ring.

To insure sufficient operating clearance for the bearing, the inner ring clamping forces given in the table should normally not be exceeded.

Housing Design

To safely support the high load capacity of spherical plain bearings, the housing must have sufficient strength to avoid excessive deformation and fatigue failure. Certain housing types like cylinder rod eyes and pivot brackets under tensile stress experience maximum stress at points perpendicular to the line of force. To obtain the maximum tensile stress, multiply the normal tensile stress of the total cross section by a factor "K" found in figure 16. The result must be less than the endurance limit of the housing material.

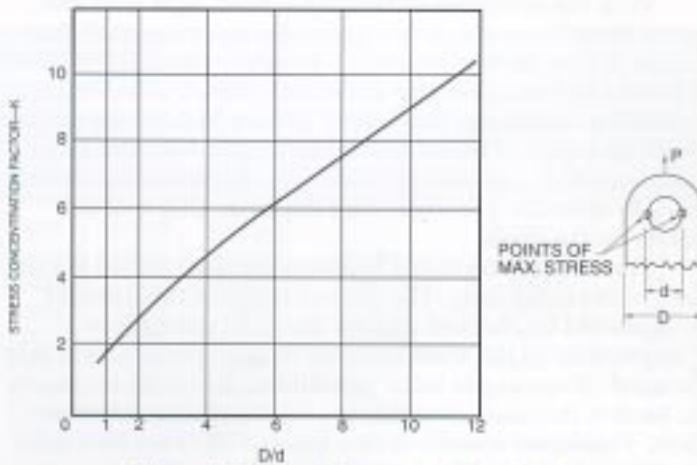

Figure 16: Stress Concentration Factor

Housings must be sufficiently strong to prevent excessive outer ring deformation. Sufficient housing strength can be achieved either by a great enough wall thickness, here expressed as a ratio of housing outside diameter divided by housing bore, or by selecting a higher strength material. The effects of housing wall thickness and strength on available bearing capacity can be observed in figure 17.

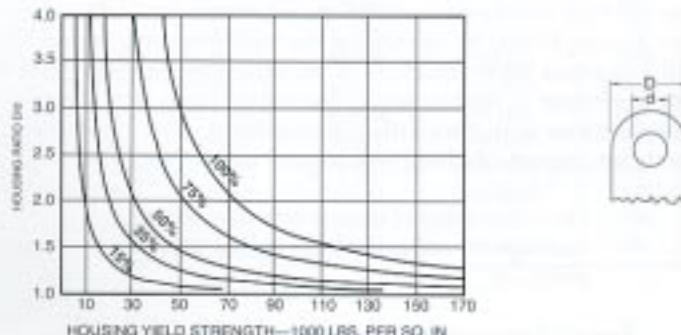

Figure 17: Influence of Housing Design on Bearing Capacity

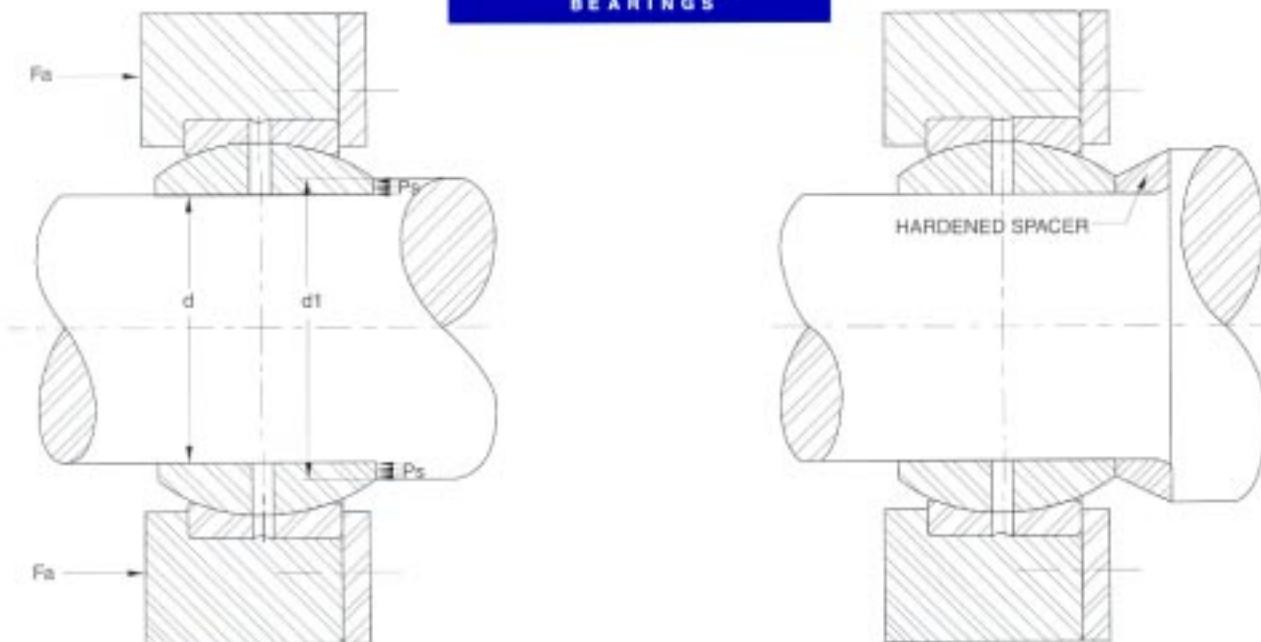

Figure 18: Reduce Contact Pressure by Using a Hardened and Tapered Spacer

Shaft Design

With the exception of bearings under light load and press fitted inner rings, it is generally recommended that shafts or pins be heat treated to a surface hardness of HRc 55 min and have a surface finish of 32 rms. Under dynamic operating conditions and with a loosely fitted inner ring, it must be expected that rotation takes place between inner ring and shaft. Under very heavy loads, even an interference fit does not guarantee that the inner ring will not rotate on the shaft.

Thrust loads on radial bearings are transmitted via the face of the inner ring. The contact stress of this annular area should be checked against the yield strength in compression of the shaft material or any spacer which may be used. Even under static conditions, it may be necessary to harden the shaft shoulder to prevent plastic deformation. Hardened spacers with a tapered OD may be used if the shoulder cannot be heat treated (figure 18).

Lubrication

Standard RBC spherical plain bearings are phosphate treated and coated with a dry film lubricant (MoS_2). This surface treatment is sufficient for static applications and occasional movements. If used in a dynamic application, the bearings must be lubricated with oil or grease.

Oil Lubrication - Steel-on-steel bearings operating in an oil bath can be essentially maintenance-free. This can be accomplished by enclosing the entire bearing assembly in a gearbox style structure or by mounting spring loaded lip seals next to the bearings. The latter is only feasible in applications with very little tilting motion. Bearings subject to large degrees of tilting will require an oil filled boot.

Note: The integral seals of spherical plain bearings are not suitable for sealing against oil pressure.

For oil lubrication at ambient temperature use #90 gear oil.

Grease Lubrication - It is recommended that the bearings be thoroughly lubricated with grease at the time of installation. Lubrication after installation may make it difficult for the grease to penetrate into the load zone. Failure to do so may cause surface damage to the bearing rings during the critical run-in period. Steel-on-steel bearings must be relubricated periodically depending on operating conditions. The frequency and efficacy of relubrication greatly influence the ultimate bearing service life. For example, more frequent relubrication is necessary if the bearings operate in a dirty and dusty environment. The grease flow through the bearing helps purge contaminants.

Radial bearings can be relubricated either through the shaft or the housing. In those cases where rotation between inner ring bore and shaft must be expected, relubrication through the shaft helps to lubricate that interface.

To become effective, the grease must be able to reach the contact area between inner and outer ring. In applications where the load direction alternates, e.g. the push-pull type action of a hydraulic cylinder, the grease will be moved around due to the different inner ring positions.

By contrast, in applications where the load always acts in the same direction, e.g. in some suspension systems, grease will not be able to flow into the load zone, if the bearing is relubricated under load. For effective lubrication, the bearing must be unloaded. Alternatively, use the RBC developed bearing with special lubricating grooves, the QUADLUBE™ series, which permits relubrication under load. See also section "More Radial Bearing Designs".

Angular contact bearings with extended lubrication grooves, series B-SA-1 and B-DSA3-1, have lubricating grooves extended to the small diameter of the outer ring to facilitate grease flow through the bearing while under load. Angular contact bearings without these lube groove extensions should not be relubricated while under heavy thrust load or air may become trapped in the grease passages which will expell the grease promptly.

Recommended grease type: for operating temperatures between -40 deg F and +250 deg F, use a lithium based grease, NLGI Grade 2, with EP and MoS_2 additives.

Bearing Failure Modes

This section is intended to help the user identify bearing problems and correct or prevent their causes. By definition, the useful service life of a spherical plain bearing has ended after one of the following condition occurs:

- Outer ring, inner ring, or both are broken.
- The coefficient of friction exceeds 0.22.
- The diametral clearance has grown to more than the application can tolerate.

1. Component Fracture

1.1 Causes of outer ring failure

- during assembly:
pressing the outer ring into the housing bore at an angle, trying to press fit the outer ring by pushing against the inner ring face, trying to press fit the outer ring with hammer blows.
- during operation:
excessive outer ring deformation due to shock loads, thin walled housing, partial outer ring support, insufficient interference fit.

1.2 Causes of inner ring failure

- during assembly:
attempting to mount bearing in the housing by pushing against the inner ring face.
- during operation:
excessive clearance between shaft and inner ring bore. Excessive shaft deflection.

2. Excessive Friction Due to Adhesive Wear

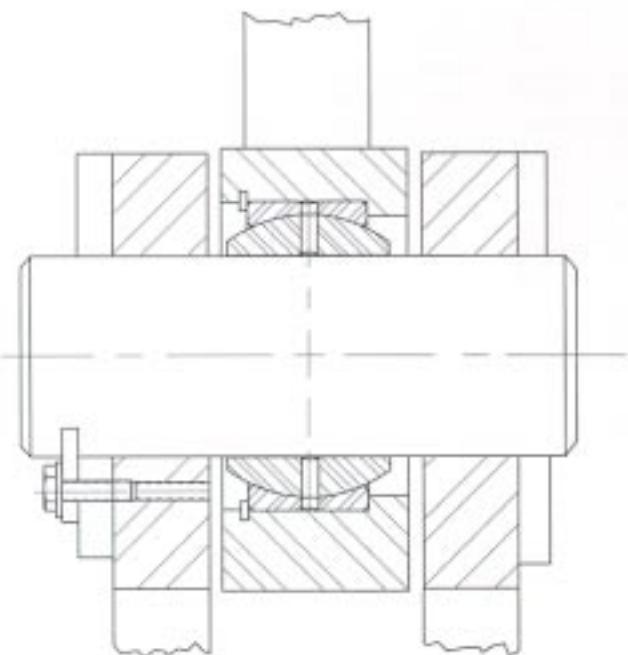

- Appearance:
Inner and outer ring spherical surfaces have deep gouge marks, chunks of metal are torn out of the surface. The bearing makes a screeching noise during operation.
- causes:
excessive PV -value, excessive dynamic load, lack of maintenance, insufficient lubrication where lubricant does not reach the load zone, contamination by hard particles, rust and corrosion.

3. Excessive Diametral Bearing Clearance Due to Abrasive Wear

- Appearance:
Inner and outer ring spherical surfaces are shiny, appear polished. Ridges are worn into the contact area.
- causes:
contamination by a powdery substance or mud, lubrication insufficient to flush wear particles from the contact area.

APPLICATIONS

Grader and Mobile Hydraulic Crane

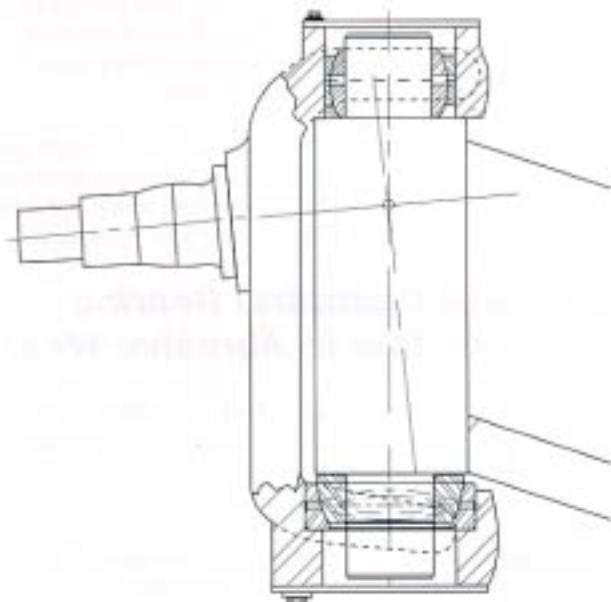

Hydraulic Cylinder

This is a typical clevis mounted bearing installed in one of the many cylinder rod ends.

Steering Axle

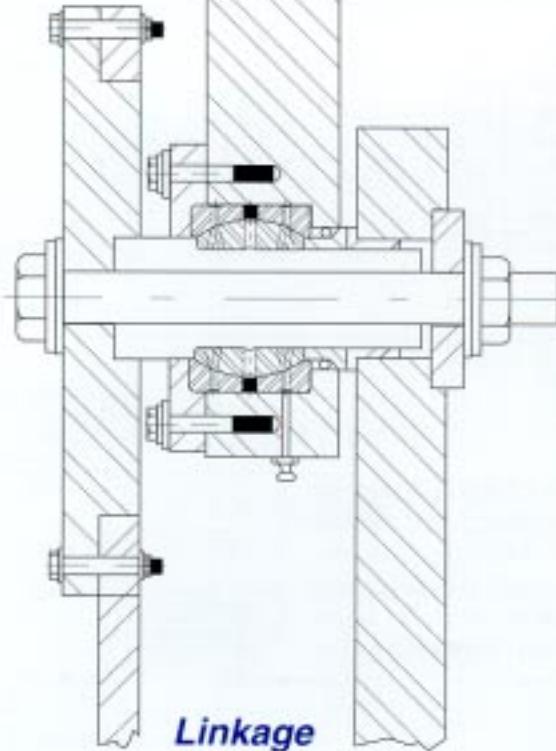

B-L and B-SA bearings complement each other in the power steering axle of the grader.

APPLICATIONS

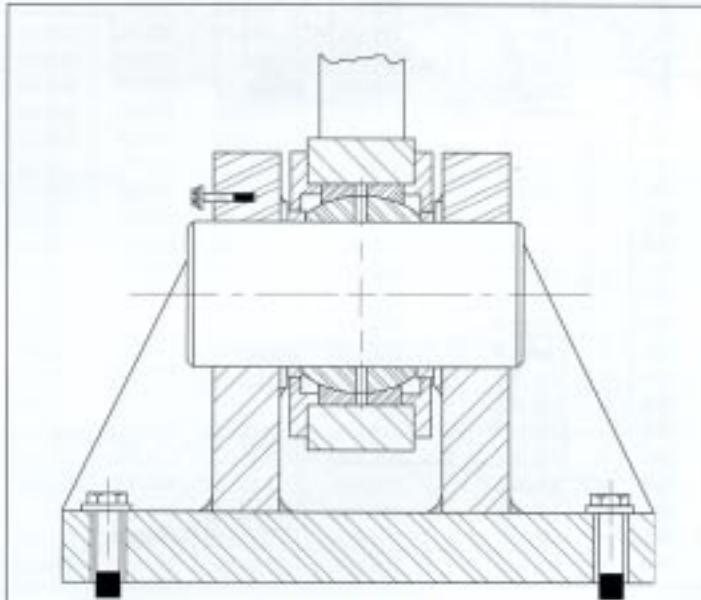

Haul Trucks

Linkage

The versatility of B-DSA-3 bearings becomes evident in a linkage assembly on the haul truck. At the factory the Shimpact™ is preset to the required width, thus ensuring a proper fit with the first installation.

Hinge Pin

The tremendous cargo weight is supported by B-L bearings in the hinge between the truck bed and frame.

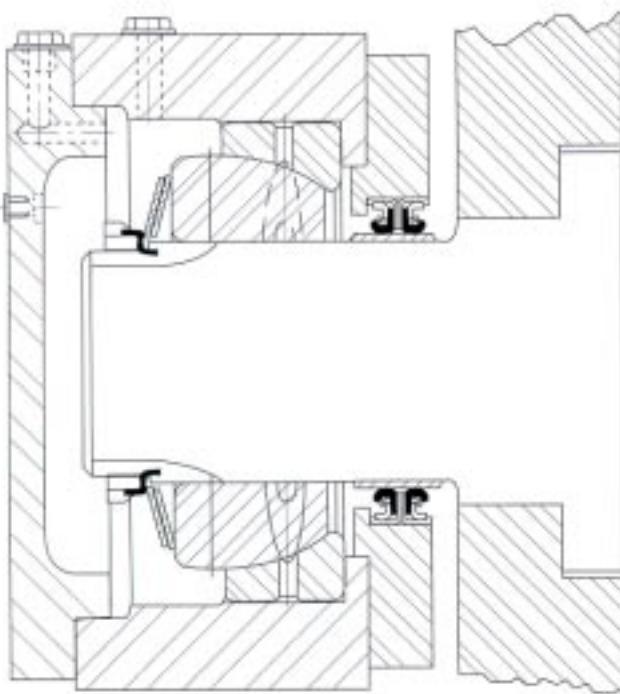

APPLICATIONS

Wind Turbine

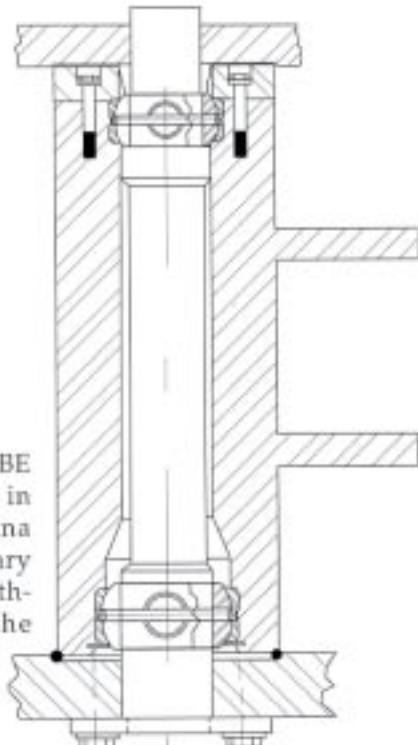

Satellite Antennas

B-SA bearings carry the thrust loads in a windmill application.

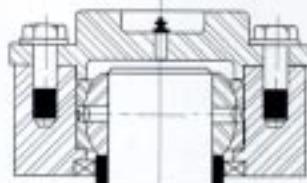

B-LSSQ QUADLUBE bearings are used in a satellite antenna where it is necessary to re-lubricate without removing the load.

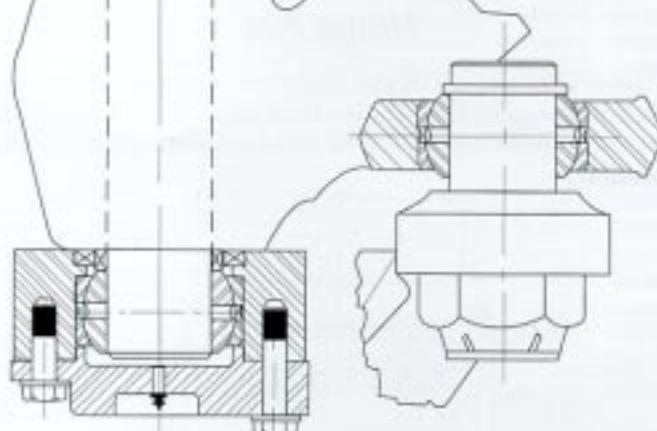

APPLICATIONS

Forklift Trucks

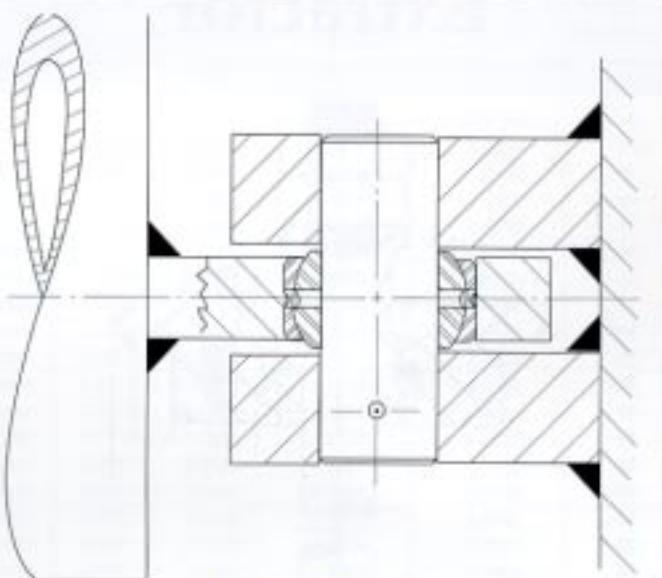

Draglink

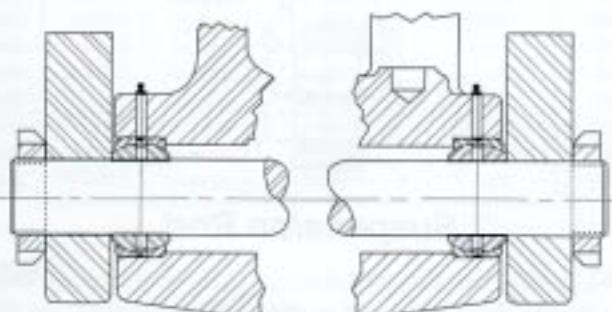

King Pin

Radial spherical plain bearings are used in the articulated steering axle, drag link and king pin of the steering assembly of the fork truck.

Tilt Cylinder

B-L bearings are used in the rod eye of the fork lift's tilt cylinder, which guide the movement of the mast.

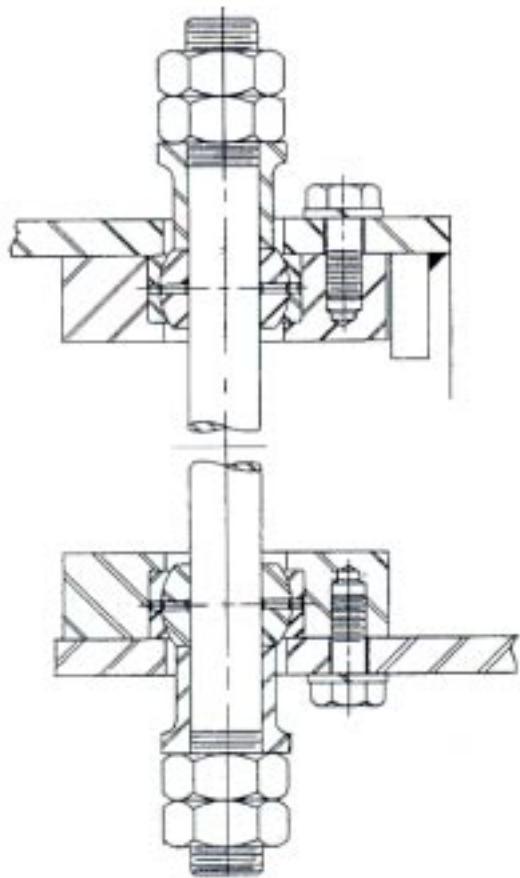

Steering Axle

APPLICATIONS

Heavy Duty Extractor

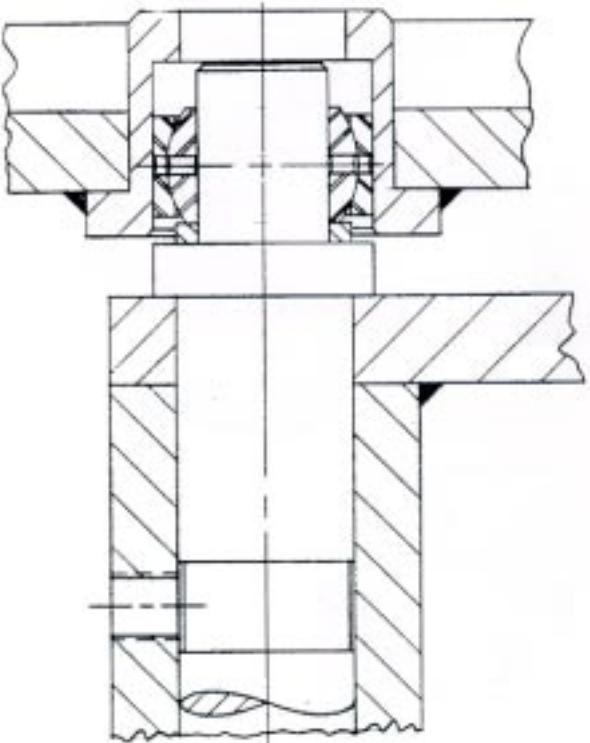

Suspension Rod

MB-L metric radial type spherical plain bearings are used in a heavy duty extractor in the textile industry. In this particular application, the bearings are used to take up the misalignment in the suspension rods.

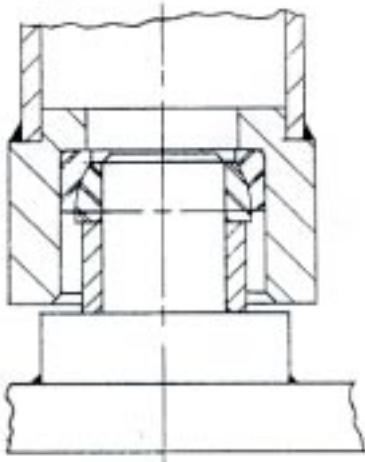

Traffic Doors

Hinge Pin

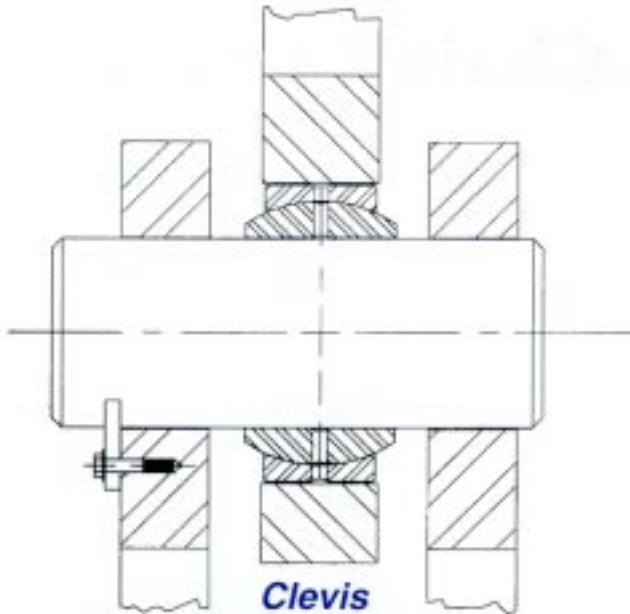

Heavy Duty traffic doors, common in warehouses and factories require B-SA (radial load only) and B-L bearings for the bottom hinges where substantial thrust loads are present.

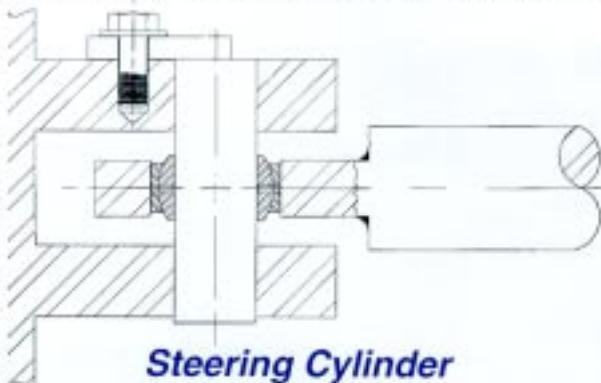

APPLICATIONS

Front End Loader

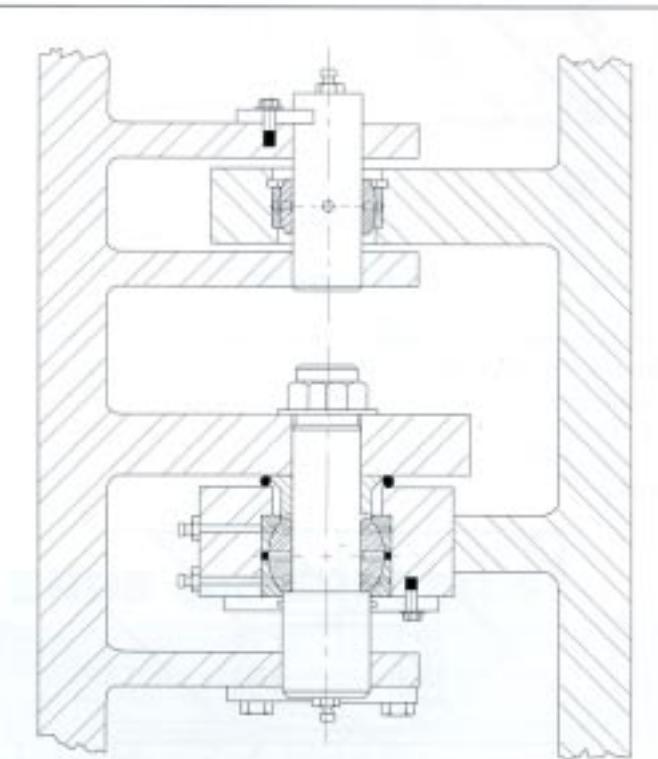

The boom cylinders and connections on the shovel incorporate a B-L bearing into a typical clevis mount application.

Steering Cylinder

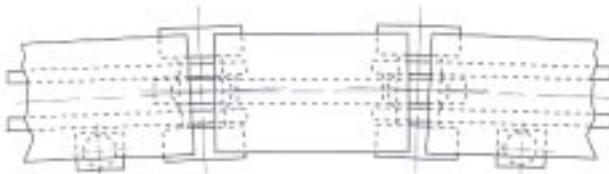

The steering cylinder of the loader uses a B-L bearing where radial loads are present.

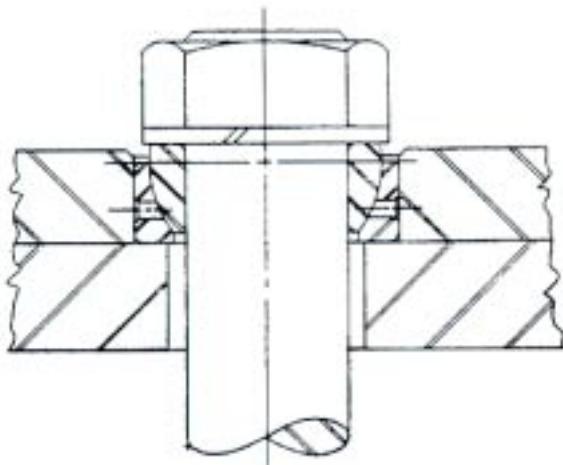

Articulated Joint

B-DSA-3 and B-L spherical plain bearings work together in an articulated joint of the front end loader. The B-DSA-3 is well suited for the heavy thrust loads in both directions which may occur in this type of application. The B-L in the top position takes only radial loads.

APPLICATIONS

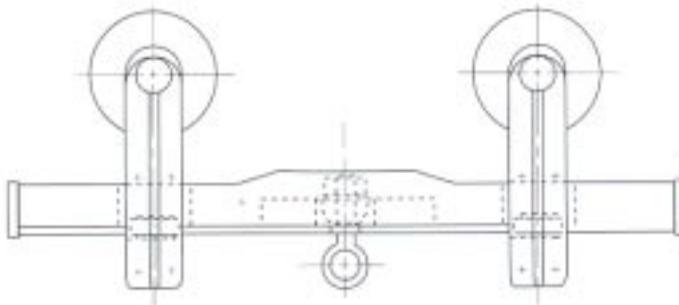

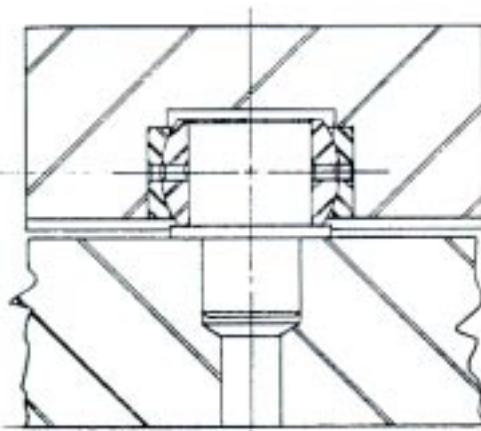

Overhead Carrier

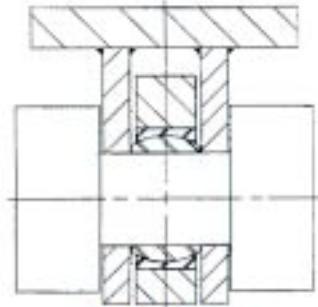

Eyebolt

An overhead carrier uses a combination of B-SA and B-L bearings to overcome the high loads carried by the eyebolt and wheels.

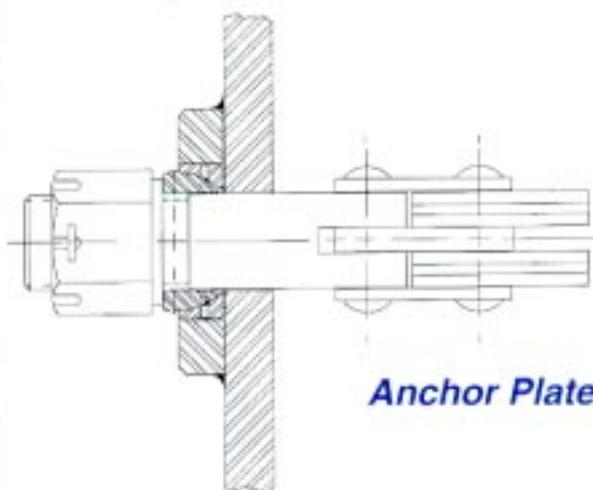

Chain Conveyor

Chain Link

In a chain conveyor, B-L radial type bearings are used to insure proper alignment of the top plates while a B-SA bearing accepts the high thrust loads in the anchor plate of the chain.

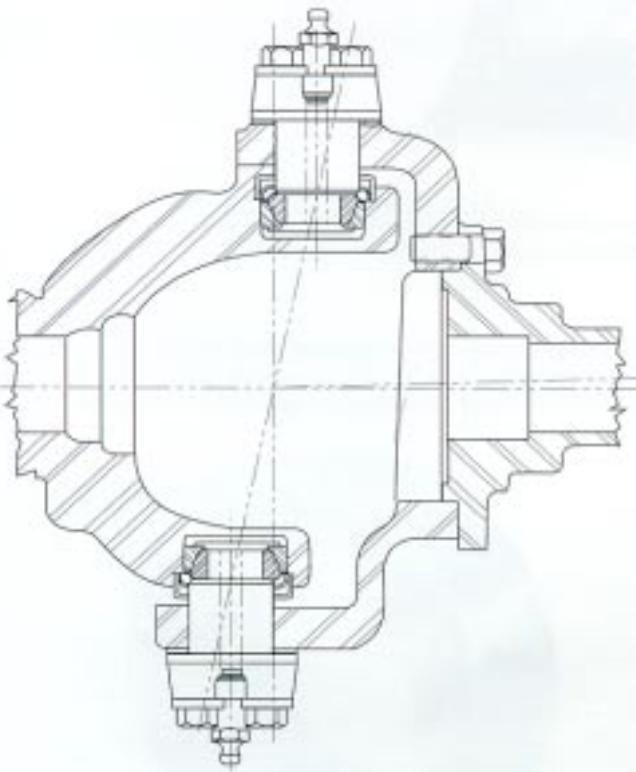

Anchor Plate

APPLICATIONS

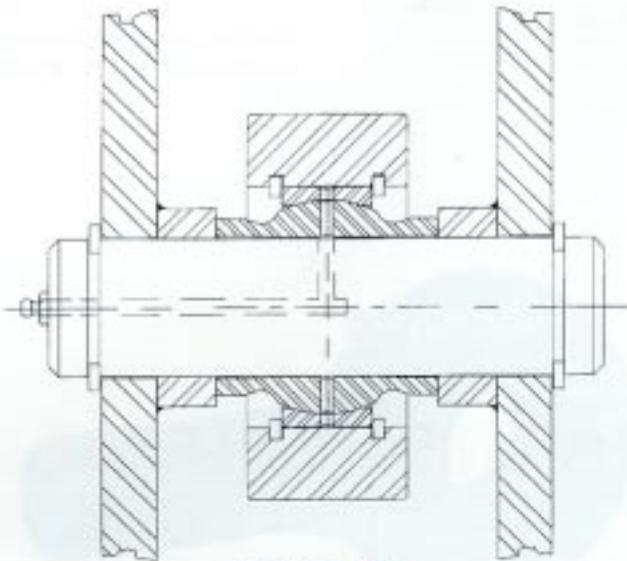

Log Skidder

King Pin

Application of two B-SA bearings in a kingpin assembly.

Tie Rod

In a typical tie rod and pin, B-EL bearing with an extended inner ring is used. This eliminates the need for annular spacers for location purposes.

SPECIALS

A spherical plain bearing with O-ring grooves to seal the O.D. against the housing and special lubrication holes in the O.D. of the outer ring. This bearing is used in the upper position of the articulating joint of a front end loader.

A thin dense chrome coated extended inner ring spherical plain bearing is pressed into a roller and used in a flexible conveyor train in underground coal mines. The thin dense chrome is used for its corrosion resistance properties.

This half-sleeve with crisscross lubrication grooves is used in a construction vehicle. It is assembled with a second half-sleeve.

A helicopter swash plate bearing, made by RBC's Transport Dynamics Division. The Teflon® liners in the I.D. of the outer ring and the bore of the ball accommodate misalignment and linear motion.

A heavy duty industrial rod end with special, left hand threads used in a forklift.

SPECIALS

An extended inner ring spherical plain bearing with spiral lubrication grooves in the bore of the inner ring to facilitate lubrication flow. This bearing is used in the suspension of a heavy duty industrial trailer.

This special rod end is for aircraft applications. It utilizes two flush type lubricators for ease of maintenance and is made by RBC's Heim Bearing Division.

This aircraft flanged spherical plain bearing, made by RBC's Heim Bearing Division, uses a threaded O.D. to provide retention. The threaded O.D. also allows for ease of replacement in the application.

A spherical plain bearing with an extended inner ring made of aluminum bronze and a double fractured, softened outer ring. It is used in large mining haul trucks.

Innovation. Commitment. Quality.

RBC has been producing bearings in the USA since 1919. In addition to unique custom bearings, RBC offers a full line of standard industrial and aerospace bearings, including:

Spherical Plain Bearings

Radial, angular contact, extended inner ring, high misalignment. **QuadLube®**, **ImpactTuff®**, **SpreadLock® Seal**, **CrossLube®** bearings, and self-lubricating bearings. Available in inch and metric sizes.

Thin Section Ball Bearings

Standard cross sections to one inch. Sizes to 40 inches. Stainless steel and other materials are available. Seals are available on all sizes and standard cross sections.

Self-Lubricating Bearings

Radial, thrust, rod ends, spherical bearings, high temperature, high loads. Available in inch and metric sizes. **Fiberglide®**.

Airframe Control Bearings

Ball bearing types, self-lubricating types, needle roller track rollers.

Pins and shafts

Bremen and **Miller** pins, needle rollers, shafts, and rollers.

Ball Screws

Precision ground, rolled, ball splines. Long life, low wear, high accuracy. **QuickTurn™ Ball Screw Repair Service**.

Rod Ends

Commercial and industrial, precision, Mil-Spec series, self-lubricating, and aircraft. **Heim Unibal®** and **Spherco®** brands. Available in inch and metric sizes.

Ball Bearings

Precision ground, semiground, unground. High loads, long life, smooth operation. **Nice** brand is offered in caged and full complement configurations.

Cam Followers

Standard stud, heavy stud, yoke type, caged roller followers. Patented **RBC Roller®** cylindrical roller cam followers, **HexLube®** universal cam followers, airframe track rollers.

Needle Roller Bearings

Pitchlign® caged heavy duty needle roller bearings, inner rings, **TJ** and **TandemRoller®** bearings for long life.

Tapered Roller Bearings

Tyson® brand case-hardened in many sizes. Used in Class 8 heavy truck and trailer wheel bearings, gearboxes, and final drive transmissions.

Specials

RBC manufactures many specialty bearings for the aerospace, oil and energy, semiconductor equipment, packaging, heavy truck, and other industries.
