

Thrust Needle Roller Bearings

Thrust needle roller bearings offer high reliability for a wide range of applications, from automobile drive trains to industrial machinery, featuring compact sizes, high load capacity, and high limiting speed.

A wide selection of high-quality series and cage-roller assemblies available for a variety of applications.

Thrust Needle Roller Bearings

1. Compact Design

Offer same cross-section height as conventional thrust washers.

2. Wear resistant and highly rigid

Surface-hardened cage provides both wear resistance and high rigidity.

3. Economical

Simple design suited for mass production makes these bearings highly economical.

4. Easy handling

Unitization of needle roller assemblies (integrated-type and cage-roller assemblies) facilitates the positioning and mounting of bearings in space-limited areas.

Thrust needle roller bearings are a type of needle roller bearing with a cage. They are compact and offer large load capacity and high limiting speed. The two-piece cage, consisting of precision-pressed steel, guides the rollers accurately (see Figs. 1 and 2). The surface-hardened cage offers superior wear resistance and strength.

Our integrated-type bearings with raceway washer are designed for applications where a low profile is desired and can easily replace conventional thrust washers. Different thicknesses of various types of raceway washers are available for these bearings, which allow selection of the appropriate thickness suited to bearing mounting conditions (see Fig. 3).

An integrated (unitized) bearing, which consists of a cage, rollers, and raceway, is also available (see Fig. 4). These bearings are widely used in automobile drive trains, compressors, hydraulic pumps, machine tools, and industrial machinery.

1. Types

Several types of thrust bearings are shown in Table 1. For inch bearings, the dimension number is expressed in integers in units of 1/16. Raceway washers are available for use when the raceway surface cannot be hardened by heat treatment and ground to the proper finish.

Types of raceway washers used for cage and roller assemblies in thrust needle roller bearings are shown in Table 2.

Code	Description
FNTA ZNTA NTA FA	Cage and roller assemblies for thrust needle roller bearings
FG (K Series)	Integrated type with raceway washer Raceway washer: JK type (with outer flange)
FG (F Series)	Integrated type with raceway washer Raceway washer: JF type (with inner flange)
FH	Integrated type with raceway washer Raceway washer: JK type + JF type

Shape symbol	Description
FTRA, FTRB, FTRC, FTRD, FTRE	Raceway washers without flange
TRA, TRB, TRC, TRD, TRE	
JDU	
JD	

2. Specification Number

The composition of bearing numbers is as follows:

Example (Metric): **FNTA - 20 35**

Type Code: FNTA
Bore diameter (mm): 20
Outside diameter (mm): 35

Example (Inch): **FH 503405**

Type Code: FH
Unique number: 503405

* For inch bearings, each dimension is expressed with whole numbers in units of 1/16 of an inch. Integrated bearings have their own unique bearing number configuration.

3. Accuracy Standards

The metric FNTA type conforms to ISO standards. The fitting tolerance of the inner dimension of the cage is class E11, and the outside diameter is class c12 (see Table 3). The inch NTA type and dimension tolerance for thrust raceways of both systems of measurement are provided in the dimension table. Roller precision is equivalent to grade 3 of ISO 3096. For details on precision of integrated bearings and raceways with flange, contact NSK.

Table 3 Dimension Tolerance for Bore Diameter and Outside Diameter

Classification of nominal dimensions of outside diameter and bore diameter (mm)		Inner bore tolerance E11 (μm)	Outer bore tolerance c12 (μm)

4. Applications for Optimal Performance

■ Mounting

When using a bearing with cage and roller assembly, a separate raceway washer is not needed if the gear side is used as a raceway. This saves space and allows the bearing to be more compact. With a housing that will not allow the gear side to be used as a raceway, using an integrated bearing facilitates handling and mounting (see Fig. 6).

In general, the accuracy, surface roughness, and hardness of the raceway components should satisfy the specifications shown in Table 4.

When a cage and roller assembly cannot be used alone, a thrust raceway washer should be selected according to the washer support face and the volume of the load. The thrust raceway washer should be set to prevent sliding between the contact surfaces.

When the area supporting the raceway washer is sufficiently large and rigid, a thin raceway washer, such as FTRA or TRA type, can be used. Even if washers are warped, an axial load of more than approximately 196 N (20 kgf) will flatten them.

When the support face of the shaft or housing is small, thick-wall raceway washers (FTRE or TRD type), or one of the other thicker types should be used (see Fig. 7).

When using raceway washers, the accuracy, shape, and size of the support face affect performance of the bearing. For squareness of the raceway washer support face, the values given in Table 4 must be applied and the support face must be sufficiently large. Please contact NSK regarding shape and accuracy.

Fig. 6

Fig. 7

Table 4 Specifications of Thrust Bearing Raceway Surface

Classification	Type	Cage or raceway guide	Tolerance class or dimension tolerance	
			Shaft	Housing
Cage and roller assembly for thrust needle roller bearing	FNTA	Bore Outside	h8 —	$D_c + \text{over } 1.0$ H10
	NTA	Bore	0 -0.075	$D_c + \text{over } 1.0$
Outside		—	H10	
Raceway washer for thrust needle roller bearing	FTRA~FTRE	Bore	h8	$D_c + \text{over } 1.0$
		Outside	—	H10
	TRA~TRF	Bore	0 -0.075	$D_c + \text{over } 1.0$
		Outside	—	H10

■ Bearing guide

Thrust needle roller bearings often use the bore guiding method, as relative speed at the guide face may be slow. If used for particularly high speeds, bore guiding is required. If design requires an outer guide, it is necessary to harden the outer guide surface to prevent wear of the housing guide.

The various FG types for integrated bearings use the raceway flange surface of the guide. The FH type can use either bore and outside surface as a guide surface, but it is important to keep one side free. Fig. 8 shows the guide methods for the various types.

Fig. 8

■ Fitting

Table 5 shows the recommended fittings for cages, roller assemblies, and raceways for thrust needle bearings. For each type of integrated bearing, the table gives recommended mounting dimensions.

Table 5 Recommended Fittings for Thrust Needle Roller Bearings

Units: mm

Classification	Type	Cage or raceway guide	Tolerance class or dimension tolerance	
			Shaft	Housing
Cage and roller assembly for thrust needle roller bearing	FNTA	Bore Outside	h8 —	$D_c + \text{over } 1.0$ H10
	NTA	Bore	0 -0.075	$D_c + \text{over } 1.0$
Outside		—	H10	
Raceway washer for thrust needle roller bearing	FTRA~FTRE	Bore	h8	$D_c + \text{over } 1.0$
		Outside	—	H10
	TRA~TRF	Bore	0 -0.075	$D_c + \text{over } 1.0$
		Outside	—	H10

■ Mounting

Observe the following precautions when mounting:

- (1) Mount so the shape of the cage is not distorted.
- (2) Remove contamination from the raceway and support surface.
- (3) Check the squareness of the raceway and support face.
- (4) If using a raceway, check the guide type.
- (5) Make sure that clearance of the guide is not too large.
